

***GRUPPO DI LAVORO SULL'ANALISI DEL RISCHIO.
A CHE PUNTO SIAMO***

Glauco Bertocchi
g.bertocchi@isacaroma.it

PREMESSA

- L'ultima volta ci siamo visti al webinar di 10 mesi fa (29 gennaio 2021)
- Se per caso, spero di no, foste curiosi potete rivedere la presentazione presente sul sito ISACA ROMA
- Molte delle cose allora dette sono state fatte, altre si sono rivelate troppo complesse o praticamente non utilizzabili
- Insomma si impara dagli errori.....o sbagliando si impara, come preferite..

Quale è stata la motivazione che ha avviato il GDL?

Provare a rispondere alla domanda :

E' possibile calcolare in modo quantitativo (valori e probabilità) il valore di un sistema ISMS tipo ISO 27k per la riduzione del rischio in azienda?

Oppure

Se la mia azienda è ISO27k compliant quanto riduco la probabilità e l'impatto di un attacco tipo ransomware ? O di altri scenari di minaccia?

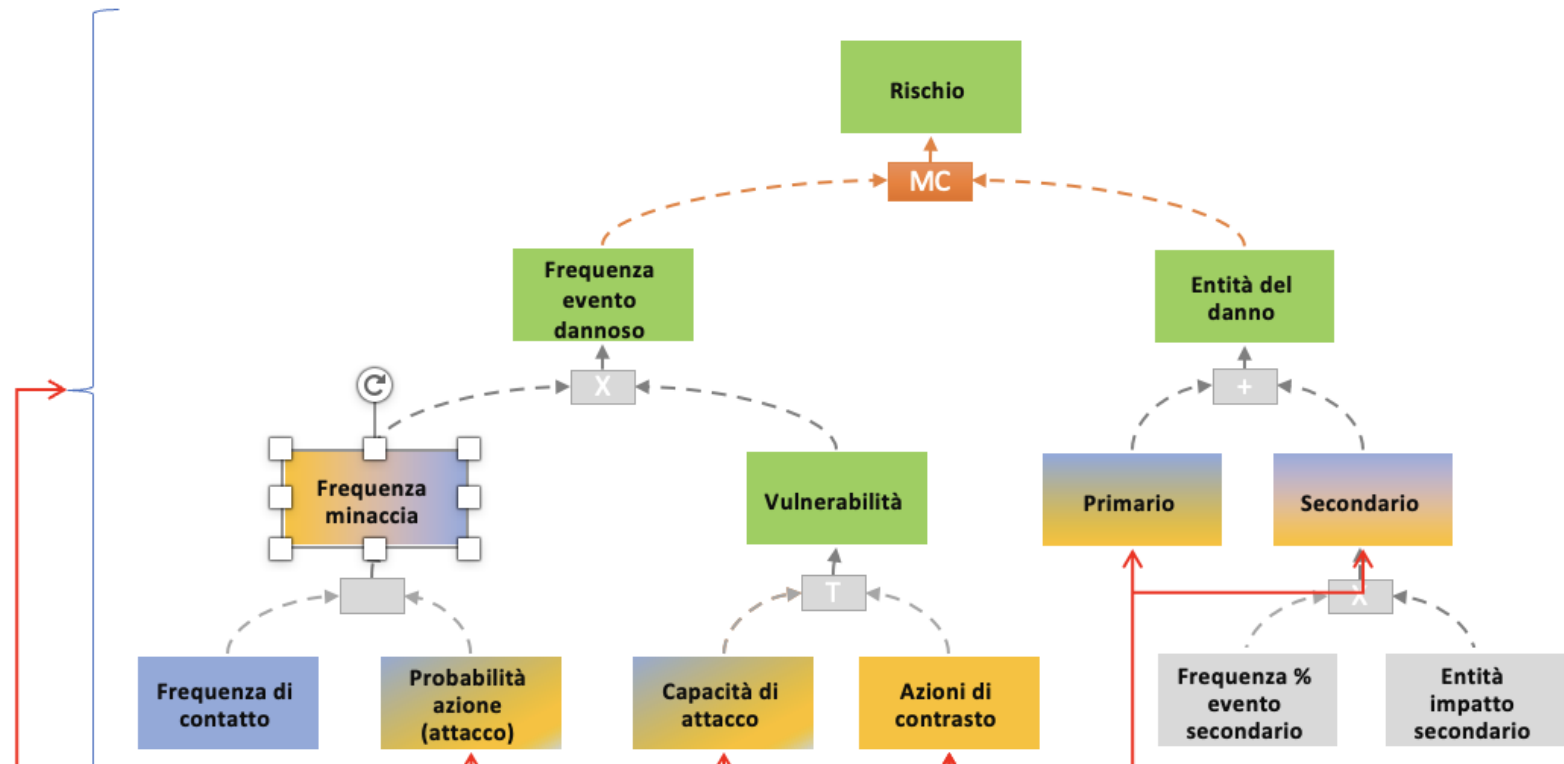

Sintesi di più di un anno di lavoro (1)

- Abbiamo avviato il Gruppo di Lavoro (GDL) più di un anno fa
- Nel frattempo abbiamo fatto molta strada
 - Abbiamo scelto FAIR come metodo quantitativo anche perché indicato da ISACA
 - Abbiamo ipotizzato di fare un «ponte» o un «mapping» tra ISO 27k e FAIR
 - Abbiamo verificato che in realtà il problema era simile per tutti i framework analoghi all'ISO 27k , ossia che prevedevano un approccio di conformità ad una serie di controlli (CIS, NIST 800-53 rev x, ..)
 - Abbiamo verificato che anche il GDPR poteva essere interessante da valutare per il profilo dei possibili danni al titolare a seguito di violazioni. IL GDPR è simile all'ISO 27701 che è l'estensione dell'ISO 27001 ai dati personali.

Sintesi di più di un anno di lavoro (2)

- Il gruppo è cresciuto numericamente : siamo arrivati ad un massimo di 15 partecipanti
- Ci siamo suddivisi in 2 sottogruppi : uno per l'ISO 27k e l'altro per il GDPR
- Abbiamo studiato e sperimentato diversi metodi di calcolo (oggi vi diamo un'idea di quelli che sono più utili)
- Abbiamo discusso anche animatamente per come realizzare al meglio quanto segue

| | |
|-----------------|--------|
| Non richiesto | Grey |
| Stima calibrata | Blue |
| Da Criteri ISO | Yellow |
| Calcolato | Green |

ISO 27001

Threat prevention
Riduce prob. di attacco

Riduce tutte le Varianze

Detection
Riduce capacità di attacco v. pag. 248

Vuln. prevention
Riduce vulnerabilità

Response
Riduce conseguenze

**Alcune volte la
complessità era tale
che siamo finiti così**

NON CI SIAMO ARRESI

- Abbiamo constatato che la definizione dei controlli FAIR (2014) era incompleta (non è stato semplice e nemmeno breve)
- Giugno 2021, abbiamo contattato Jack Jones (il coautore di FAIR), gli abbiamo detto cosa volevamo fare, cosa stavamo facendo e quali erano secondo noi i problemi con FAIR
- Ci ha risposto che stava lavorando a una nuova versione e ci ha proposto di condividerla in anticipo ed era interessato al nostro mapping di ISO27k

Da giugno in poi..

- Abbiamo sospeso il sottogruppo GDPR, infatti se non si risolveva il mapping ISO 27001 non si poteva affrontare GDPR e ISO27701
- Abbiamo continuato il lavoro di mapping ISO 27001 con la nuova versione dei controlli FAIR (ve ne parleremo a breve)
- Il 20 ottobre abbiamo presentato il lavoro sinora svolto alla FAIRCON21 (conferenza annuale del FAIR INSTITUTE a livello world wide) con un breve video
- Dobbiamo completare il lavoro
- Riprenderemo anche il lavoro GDPR

Agenda

- Un riepilogo dei concetti base e dei metodi delle valutazioni quantitative a partire dalla nostra esperienza , con esempio di calcolo dal vivo
- Una illustrazione della nuova ontologia dei controlli FAIR (useremo la presentazione di Jack Jones). Ci sono concetti molto interessanti da approfondire
- Un esempio del nostro mapping ISO 27k FAIR
-

I
partecipanti
alla
FAIRCON21

- Glauco Bertocchi
- Alessia Valentii
- Mario Taddonio
- Alberto Piamonte
- Maurizio Pagano
- Giuseppe Cagnetta
- Francesca Della Mea
- Luca Fei

Gli altri partecipanti

- Ringraziamo chi ci ha dato il suo contributo e poi ha dovuto lasciare : Luciano Capone, Cristina Nunu, Silvano Bari, Raffaella D'alessandro,.
- Sono rimasti in «panchina» (gruppo GDPR)
 - Fabio Pieralice
 - Riccardo Cocozza
 - Fabio Turano

Grazie per l'attenzione
Passo la parola al prossimo relatore

AGGIORNAMENTO FAIR

The Biggest Cybersecurity Risk

Question: What is Your Single Biggest Risk in Cybersecurity?

Answer: How You Measure Cybersecurity Risk

Il metodo FAIR

- Un'associazione ed uno standard documentato e riconosciuto
- Un testo completo, pratico ed efficace che:
 - Identifica i fattori che determinano il rischio
 - Individua le aree possibili di intervento
 - Spiega come procedere per livelli di dettaglio progressivi
 - Considera il «*come*» comunicare i vari fattori del rischio
 - Istruzioni pratiche (*da «cosa» a «come»*)!
 -

■ 4.1.3 Risk Assessment and Analysis

■

■ If a risk is identified, enter it into a list, sometimes called a risk register, and determine the next step in analysis or response. This step in the risk management process often needs further analysis of the **risk factors** to determine an effective course of action or cost-justification for a plan of remediation.

- A recommended decision analysis process is to use Monte Carlo modeling and simulation analysis to rank-stack, or prioritize, the list of risk concerns in a risk register for appropriate responses.
- Monte Carlo simulations, such as those used in the Factor Analysis of Information Risk¹ (FAIR^{CR}) method, view risk as a function of likelihood (frequency of something happening) and impact.

■ **The full analytic model of FAIR enables Monte Carlo analyses; however, it can be used to statically assess best- and worst-case outcomes of scenarios to enable quick triaging.**

■

Dal nuovo Risk IT.....

Requirements for Risk Assessment Methodologies

3 What Makes a Good Risk Assessment Methodology?

It is important that the information provided by the risk assessment is meaningful to both IT and non-IT management. There is one key component and several key traits that can help a risk assessment methodology provide meaning to an organization.

3.1 Key Component: ~~Taxonomy~~

Ontology

First and foremost, the risk management framework should provide a taxonomy for risk. Taxonomies are used to help those who study a certain body of knowledge to describe and define their problem space. A taxonomy provides a means for categorizing the information around us and helps organize the volumes of information in the field, increase the effectiveness of communication, and develop standardization.

A taxonomy for risk should seek to remove the ambiguity from terms like threat, vulnerability, and risk (itself having valid but similar definitions to threat and vulnerability).

3.2 Key Risk Assessment Traits

This section describes the traits that are indicative of a good risk assessment methodology. The set of traits provided is by no means complete or comprehensive, but establishes the fundamental concepts that risk assessment methodology development should strive for.

3.2.1 Probabilistic

A study and analysis of risk is a difficult task. Such an analysis involves a discussion of potential states, and it commonly involves using information that contains some level of uncertainty. And so, therefore, an analyst cannot exactly know the risk in past, current, or future state with absolute certainty.

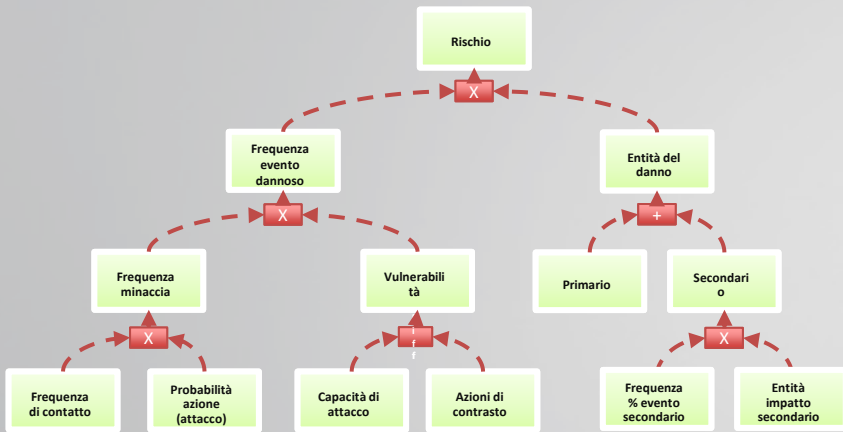

But ultimately a statement concerning risk is a belief statement – a belief statement that is simply the act of describing the issue currently at hand (sometimes referred to as a “state of nature”) based on the evidence available at the time. The act of creating a belief statement based on evidence lends itself to using probabilistic methods. Treating risk as a probability problem can add needed rigor, scrutiny, and structure to the risk analysis process and outcome.

A good risk assessment methodology will be organized so as to assist the analyst in creating probabilities for risk and its component factors.

3.2.2 Accurate

A good risk assessment methodology should deliver accurate results. And while it seems self-evident that the results of the risk assessment should be accurate, many risk assessment methodologies focus more on the technical aspects of system weakness instead of the probability of exploitation and resultant impact.

Ontologia

Ontologia è il tentativo di formulare uno **schema concettuale esaustivo e rigoroso nell'ambito di un dato dominio**; si tratta generalmente di una struttura gerarchica di dati che contiene tutte le **entità rilevanti**, le **relazioni** esistenti fra di esse, le **regole**, gli assiomi, ed i vincoli specifici del dominio.

[Wikipedia: ontologia (informatica)]

Probabilistico

- Uno studio e un'analisi del rischio è un compito difficile, infatti, spesso si deve partire da ipotesi fondate su informazioni incomplete, che contengono quindi un certo livello di incertezza.
- Tale “incertezza” non va mascherata, ma deve costituire anch'essa parte dell'informazione.
- Essa va quindi misurata e registrata perché divenga parte di una corretta analisi del rischio.
- L'incertezza può e deve essere un attributo dell'informazione, piuttosto che un limite della stessa.
- La sua comunicazione e il suo uso possono ottimizzare la gestione del rischio ed in particolare quella degli eventi dannosi e delle loro conseguenze.
- Solo trattando il rischio come un problema di previsione probabilistica può aggiungere il necessario rigore, controllo e struttura al processo di analisi.
- Una buona metodologia per la valutazione del rischio deve fornire all'analista gli strumenti per la stima delle sue probabilità e di quelle dei fattori costituenti.

Accuratezza e Precisione

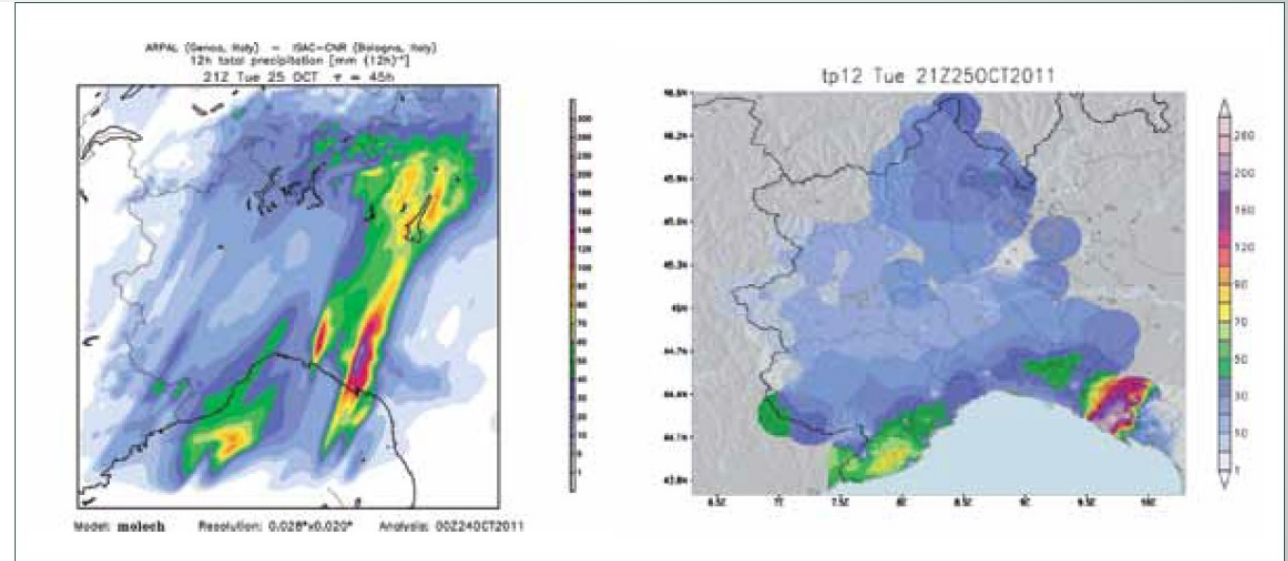

- Accuratezza e precisione sono due termini spesso utilizzati in modo errato nel contesto della misurazione, perciò è importante conoscerne bene la differenza.
- L'**accuratezza** indica quanto una misura vicina è al valore reale, e quindi, **descrive una proprietà del risultato**.
- La **precisione**, d'altra parte, quantifica il grado di efficacia con cui sono state effettuate le misure, o quanto bene sono stati effettuati i calcoli.
- La precisione **dice qualcosa sul processo di misurazione** o sul calcolo, ma non dice nulla sul risultato della misurazione o sul valore calcolato.

Il valore della previsione, ovvero non solo qualità, ma anche utilità

Se la qualità si misura attraverso la “differenza” tra la previsione e l’osservazione, il valore indica la capacità di una previsione di incidere sui processi decisionali degli utenti che ne fanno uso: una previsione sarà di alto valore se permetterà a un *decision maker* di prendere la decisione più corretta in un dato contesto.

From a Compliance-based to a RISK-based Approach to Cyber Risk Quantification and Operational Risk

Organizations are increasingly transitioning to risk-based approaches to information security and operational risk, as compliance to regulations alone provide only a minimum layer of security and fail to adequately protect them.

- Information risk has become a business issue, not just a technology issue, as most business processes have digitalized.
- Boards of directors and business executives want to understand an organization's loss exposure in financial terms to enable effective decision-making.
- Risk and security professionals must become facilitators of the balance between protecting the organization and running the business.

Il valore della previsione, ovvero non solo qualità, ma anche utilità

Ontologia FAIR

Come misurare le grandezze coinvolte ? Un concetto fondamentale:

Definition of Measurement

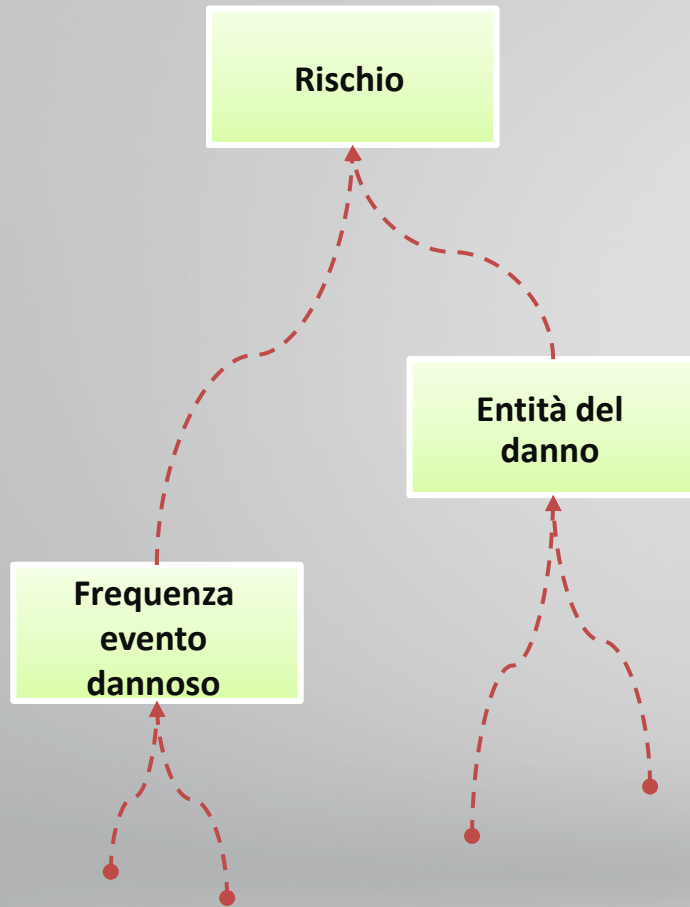

Measurement: A quantitatively expressed reduction of uncertainty based on one or more observations.

The practical differences between this definition and the most popular definitions of measurement are enormous.

Not only does a true measurement not need to be infinitely precise to be considered a measurement, but the lack of reported error—implying the number is exact—can be an indication that empirical methods, such as sampling and experiments, were not used (i.e., it's not really a measurement at all).

Measurements that would pass basic standards of scientific validity would report results with some specified degree of uncertainty, such as, “**There is a 90% chance that an attack on this system would cause it to be down somewhere between 1 and 8 hours.**”

.... A measurement is, ultimately, **just information**, and there is a rigorous theoretical construct for information. field called “information theory”, was developed in the 1940s by Claude Shannon, an American electrical engineer and mathematician.

The Concept of Measurement

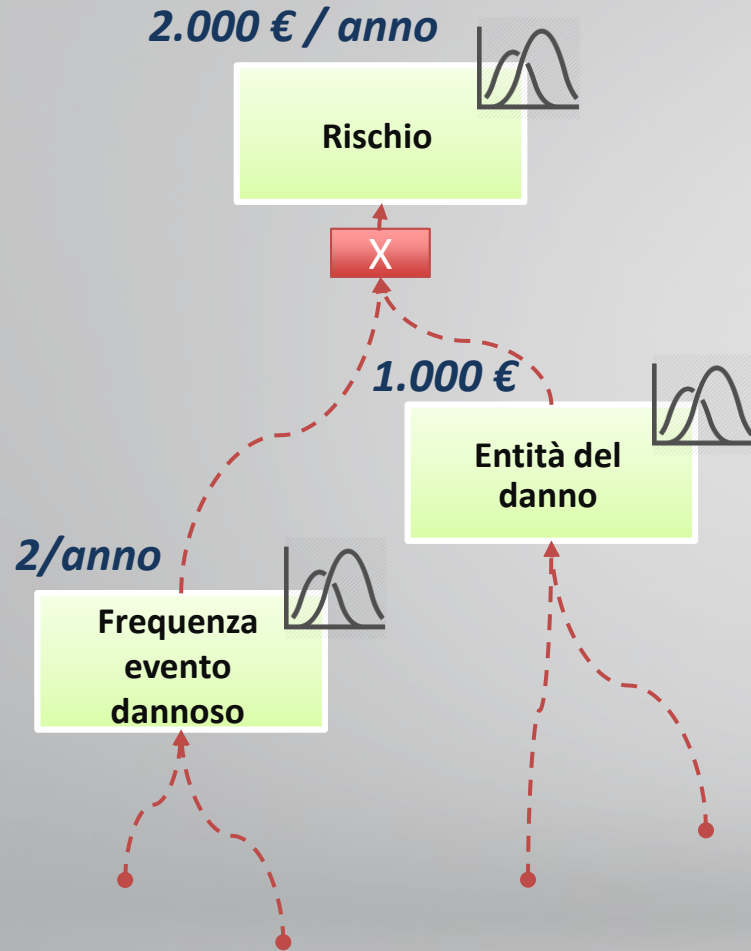

It's not a point value.

- Measurement: a quantitatively expressed reduction in uncertainty based on observation.
- You can quantify your current uncertainty – additional observations reduce it.
- Even marginal reductions in uncertainty can be extremely valuable.

Distribuzione dei possibili valori, complessivamente copre il 100% delle possibilità

La matematica «dell'incertezza»

Doing “Uncertainty Math”

Using ranges to represent your uncertainty instead of unrealistically precise point values clearly has advantages. When you allow yourself to use ranges and probabilities, **you don't really have to assume anything you don't know for a fact.** But precise values have the advantage of being simple to add, subtract, multiply, and divide in a spreadsheet. If you knew each type of loss exactly it would be easy to compute the total loss. Since we only have ranges for each of these, we have to use probabilistic modeling methods to “do the math.”

So how do we add, subtract, multiply, and divide in a spreadsheet when we have no exact values, only ranges?

Fortunately, there is a practical, proven solution, and it can be performed on any modern personal computer—the “**Monte Carlo**” simulation method. A Monte Carlo simulation uses a computer to generate a large number of scenarios based on probabilities for inputs. For each scenario, a specific value would be randomly generated for each of the unknown variables. Then these specific values would go into a formula to compute an output for that single scenario. This process usually goes on for thousands of scenarios.

Come esprimere l'incertezza ?

La gamma (estensione dei possibili valori) ci consente di esprimere numericamente il nostro livello di incertezza:

Oppure :

ma non :

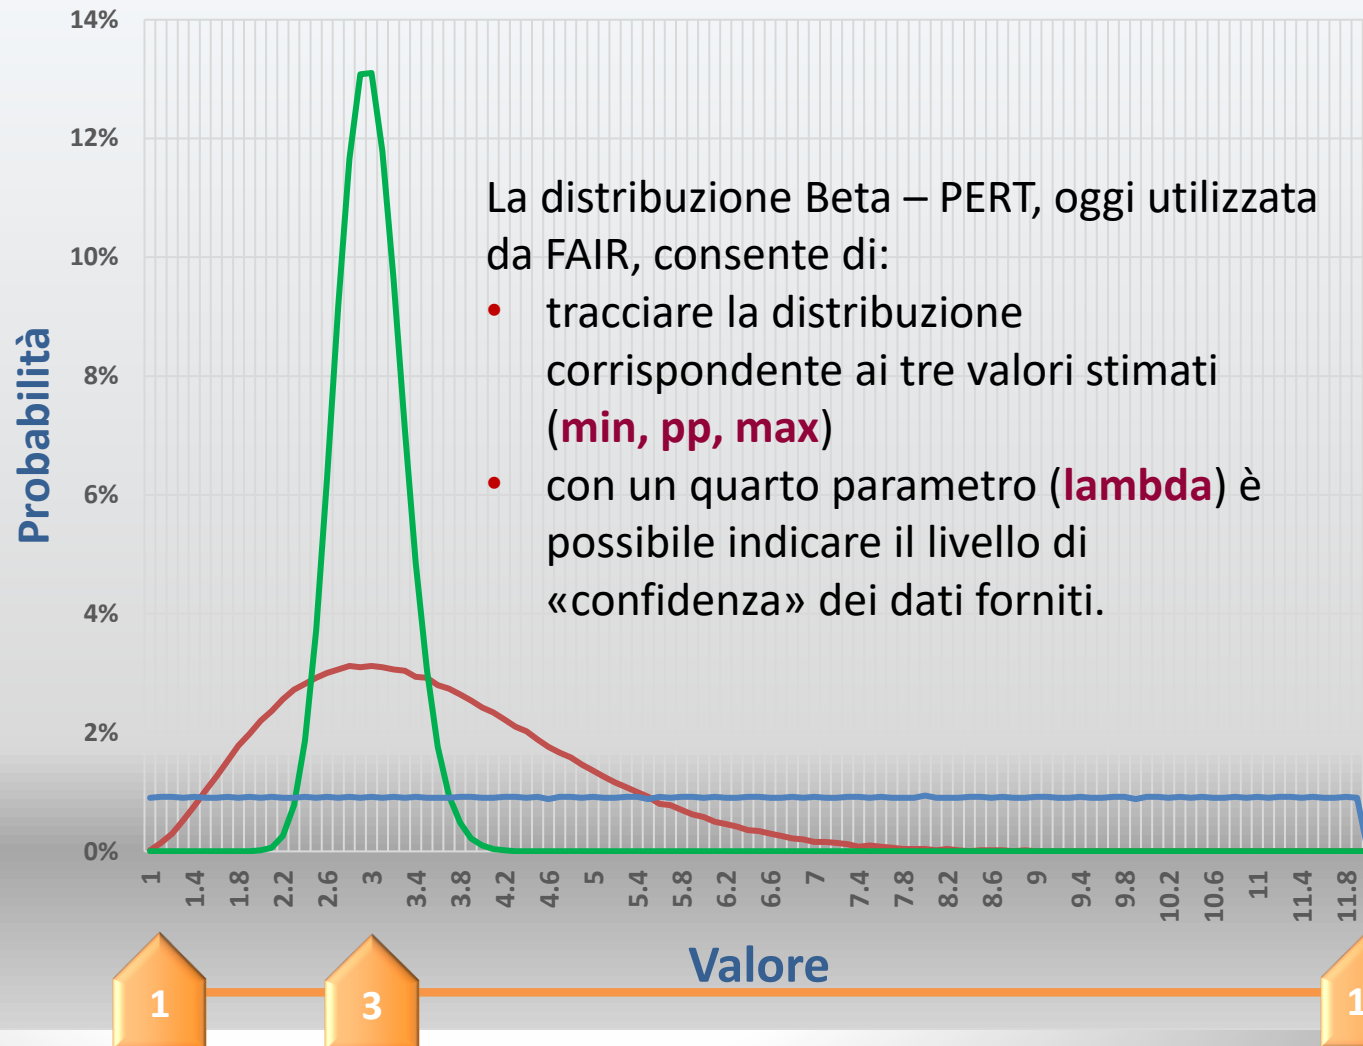

Da gamma a distribuzione

La distribuzione triangolare e la beta-Pert

Distribuzione Beta-PERT

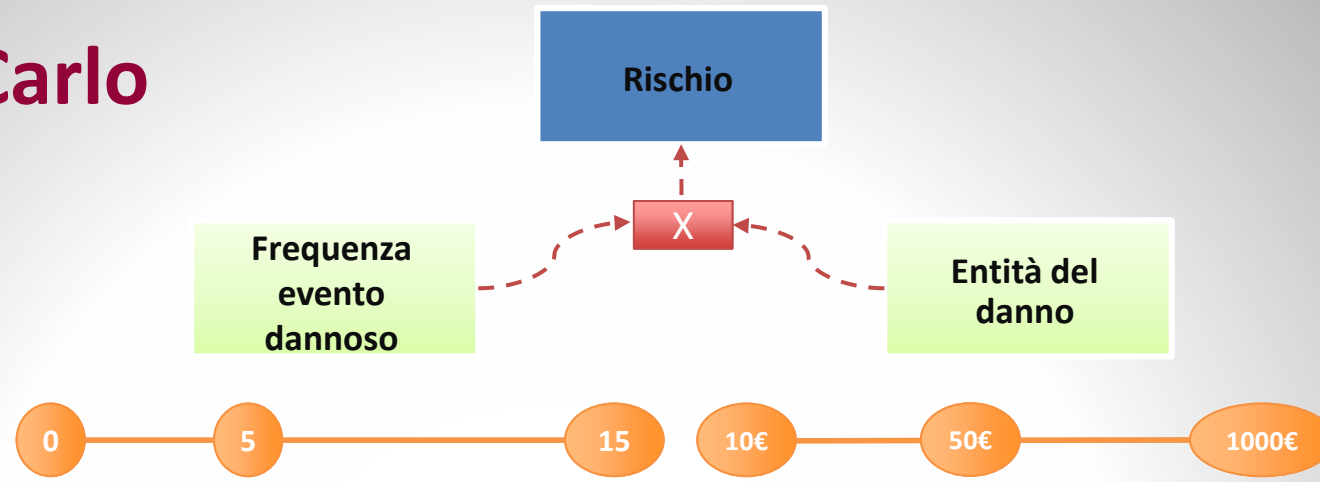

La distribuzione Beta – PERT, oggi utilizzata da FAIR, consente di:

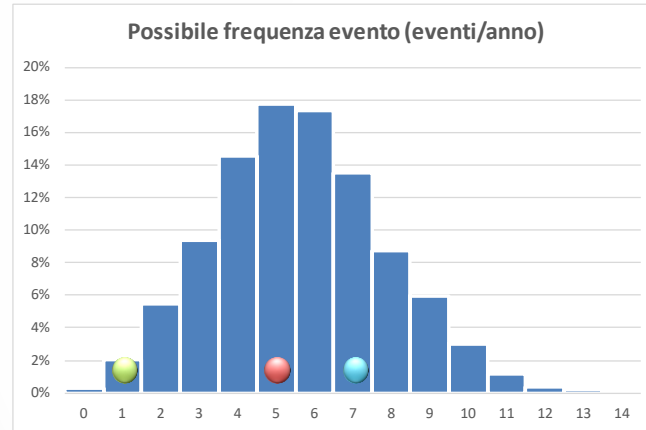

- tracciare la distribuzione corrispondente ai tre valori stimati (**min**, **pp**, **max**)
- con un quarto parametro (**lambda**) è possibile indicare il livello di «confidenza» dei dati forniti.

No Data? No Problem

by Jack Jones

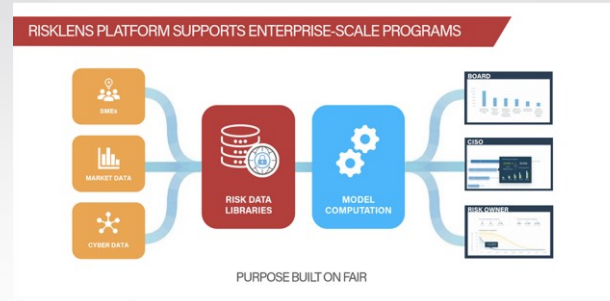

-
 - Start with an absurd estimate (e.g., less than an inch or greater than ten feet tall). It breaks the ice and gets people out of the “I have no idea” mindset.
 - Use references and logical reasoning to begin narrowing the range.
 - Challenge your reasoning along the way, and consciously look for reasons your range might be wrong.
 - Remember that ***accuracy – not precision – is king***. Many people gravitate toward precision, but that’s a great way to end up with an inaccurate answer.

Open FAIR™ Risk Analysis Tool

Click to Navigate: Risk, Loss Event Frequency, Loss Magnitude

This tool lets analysts compare two risk states: the "current" (*status quo*) state and a "proposed" (mitigated) state. There are three pages, which may be navigated between using the buttons above. You may graph distributions of either Loss Events and Loss Magnitude.

Every box in white is an input. Analysts can start from the **Risk** page to set up the local currency and loss measure of annual loss exposure. On any page you may specify a percentile or a threshold of the output, and view the chance of exceedance.

Use the **Loss Event Frequency (LEF)** page to work at any level of the FAIR LEF tree to enter loss event-related data.

Use the **Loss Magnitude (LM)** page to enter Loss Magnitude data. You may also view either simulated Single Loss Magnitudes or Total Risk Exposure outcomes.

FAIR-CAM™ MODEL: Control Functional Domain Relationships

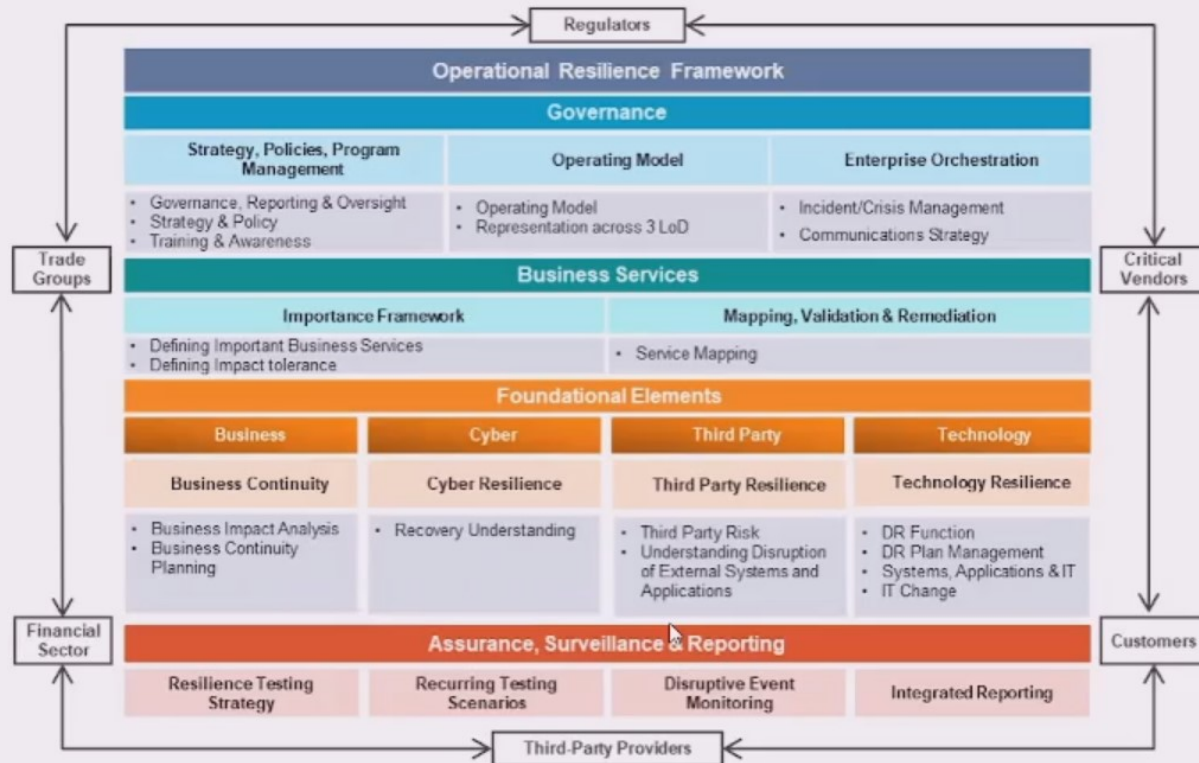

Un approccio sistematico

OPERATIONAL RESILIENCE FRAMEWORK

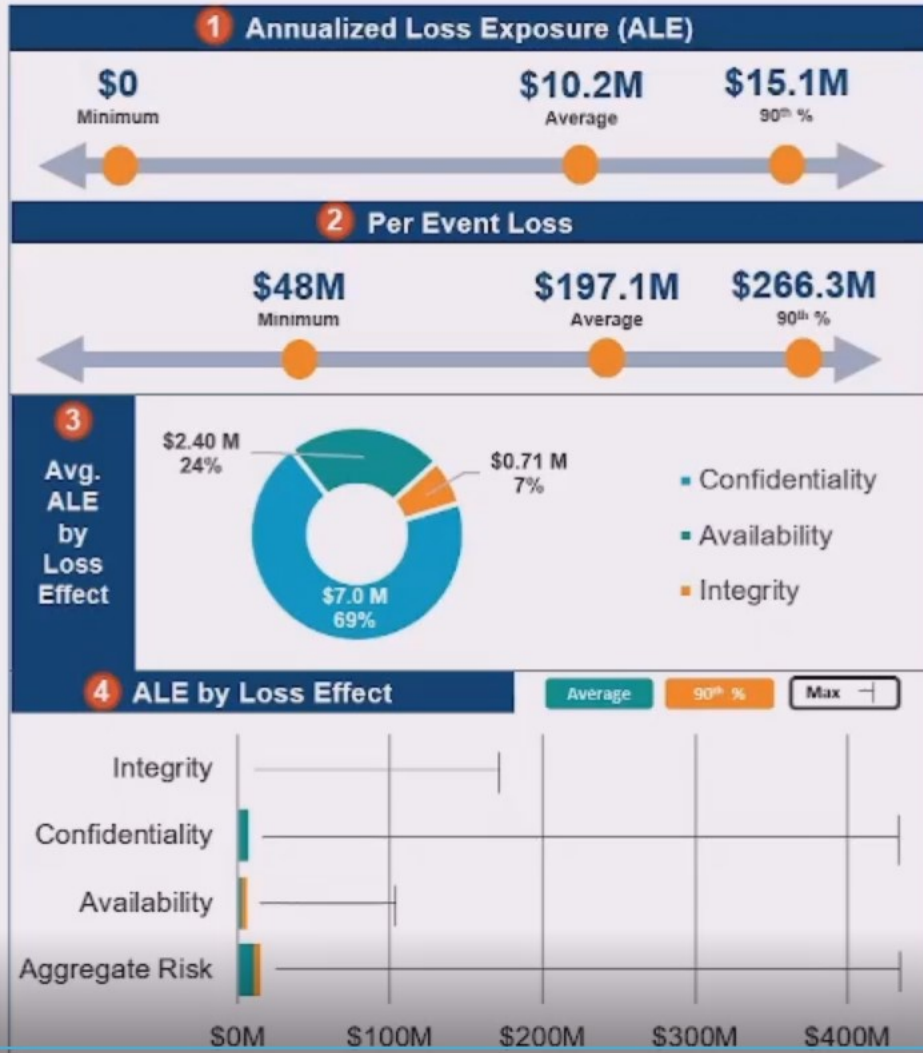

Protiviti's Operational Resilience Framework identifies the key components firms must consider when formalizing and managing resilience of the important business services they operate.

CASE STUDY – MAMMOTH BANK

EXECUTIVE SUMMARY – MAMMOTH BANK SCENARIO RESULTS

Introduction to the FAIR Controls Analytics Model (FAIR-CAM)

Jack Jones

Chairman FAIR Institute

Ask yourself these questions...

- What's the most valuable control in your cybersecurity program?
- What's the least valuable control?

Would your answers be the same as someone else's in your organization?

Is it important to be able to answer these questions?

What do we mean by “value”?

The value proposition of any risk management control boils down to this:

Its ability to affect the frequency or magnitude of loss

Ask yourself these questions...

- How does patching reduce risk? How do you measure its effect?
- What about policies, awareness training, or logging?
- How does risk analysis reduce risk?

What's been missing...

In the practice of medicine, which is more important?

Anatomy?
(The parts of the system)

OR

Physiology?
(How the system works)

Neither. You need to know both.

Human Anatomy vs. Physiology

- **Anatomical component:** Spleen

- Size: Approximately 1 x 3 x 5 inches
- Weight: Approximately 7 oz
- Location: Upper-left abdomen

- **Purpose:** Supports the immune system

- **Physiology**

- Function: Blood filtering via white pulp and red pulp
- Depends upon: Arteries, veins, nerves, lungs, etc...
- Is depended upon by: Liver, brain, etc...
- When missing or damaged is partially compensated for by: Lymph nodes, etc...

In other words, it's part of a system.

Cybersecurity Anatomy vs. Physiology

- **Anatomical component:** Awareness training
 - Content: Passwords, phishing, clean desk, etc.
 - Periodicity: Annual
- **Purpose:** Informs personnel of expectations
- **Physiology**
 - Function: Reduces the frequency of variant (i.e., deficient) control conditions
 - Depends upon: Policies, risk appetite, risk measurement, etc...
 - Is depended upon by: Authentication, system security, access privileges, physical security, data protection, etc...
 - When deficient, may be partially compensated for by: DLP, password enforcement, Anti-malware, etc.

Example of cybersecurity “anatomy” (ISO27001)

A.9.2 User access management

Objective: To ensure authorized user access and to prevent unauthorized access to systems and services.

| | | |
|---------|--|---|
| A.9.2.1 | User registration and de-registration | <i>Control</i> A formal user registration and de-registration process shall be implemented to enable assignment of access rights. |
| A.9.2.2 | User access provisioning | <i>Control</i> A formal user access provisioning process shall be implemented to assign or revoke access rights for all user types to all systems and services. |
| A.9.2.3 | Management of privileged access rights | <i>Control</i> The allocation and use of privileged access rights shall be restricted and controlled. |
| A.9.2.4 | Management of secret authentication information of users | <i>Control</i> The allocation of secret authentication information shall be controlled through a formal management process. |
| A.9.2.5 | Review of user access rights | <i>Control</i> Asset owners shall review users’ access rights at regular intervals. |
| A.9.2.6 | Removal or adjustment of access rights | <i>Control</i> The access rights of all employees and external party users to information and information processing facilities shall be removed upon termination of their employment, contract or agreement, or adjusted upon change. |

But, how controls function, and function together, to reduce risk has been mostly undefined, leaving us to rely on...

Mental models

FAIR Controls Analytics Model (FAIR-CAM)

FAIR-CAM Objectives

- Describe controls physiology so that we can:
 - Bridge the gap between controls “anatomy” and risk
 - Properly account for individual control functionality as well as systemic functionality
 - Reliably forecast, measure, and validate control efficacy and value
 - Enable better use of security telemetry
 - Evaluate program maturity more effectively
- Become an industry standard
 - Anticipate that this will be covered under a creative commons Attribution-Non Commercial-No Derivative license, similar to how the Open Group and CIS protect their work
 - ▶ Licensing and exemption processes will be available

Setting expectations...

Modern medicine is complex because human physiology and pathology are complex.

If we want to effectively manage a problem space like cybersecurity, we have to account for its complex nature.

There is no easy button for cybersecurity.

Clarifying terms

Controls:

“Anything used to directly or indirectly affect the frequency or magnitude of loss.”

Examples:

Policies
Passwords
Patching
Data backups
Auditing
etc...

Control Functions:

“How a control directly or indirectly affects the frequency or magnitude of loss.”

Examples:

Loss Event Prevention
Loss Event Detection
Variance Prevention
Variance Correction
etc...

Current controls functions in the industry?

Problems include, but aren't limited to:

- Doesn't differentiate between functions that directly vs. indirectly affect risk (commonly inferred that all controls affect risk directly)
- Doesn't account for dependencies between controls
- Not granular enough to enable accurate or verifiable measurement of control efficacy or value

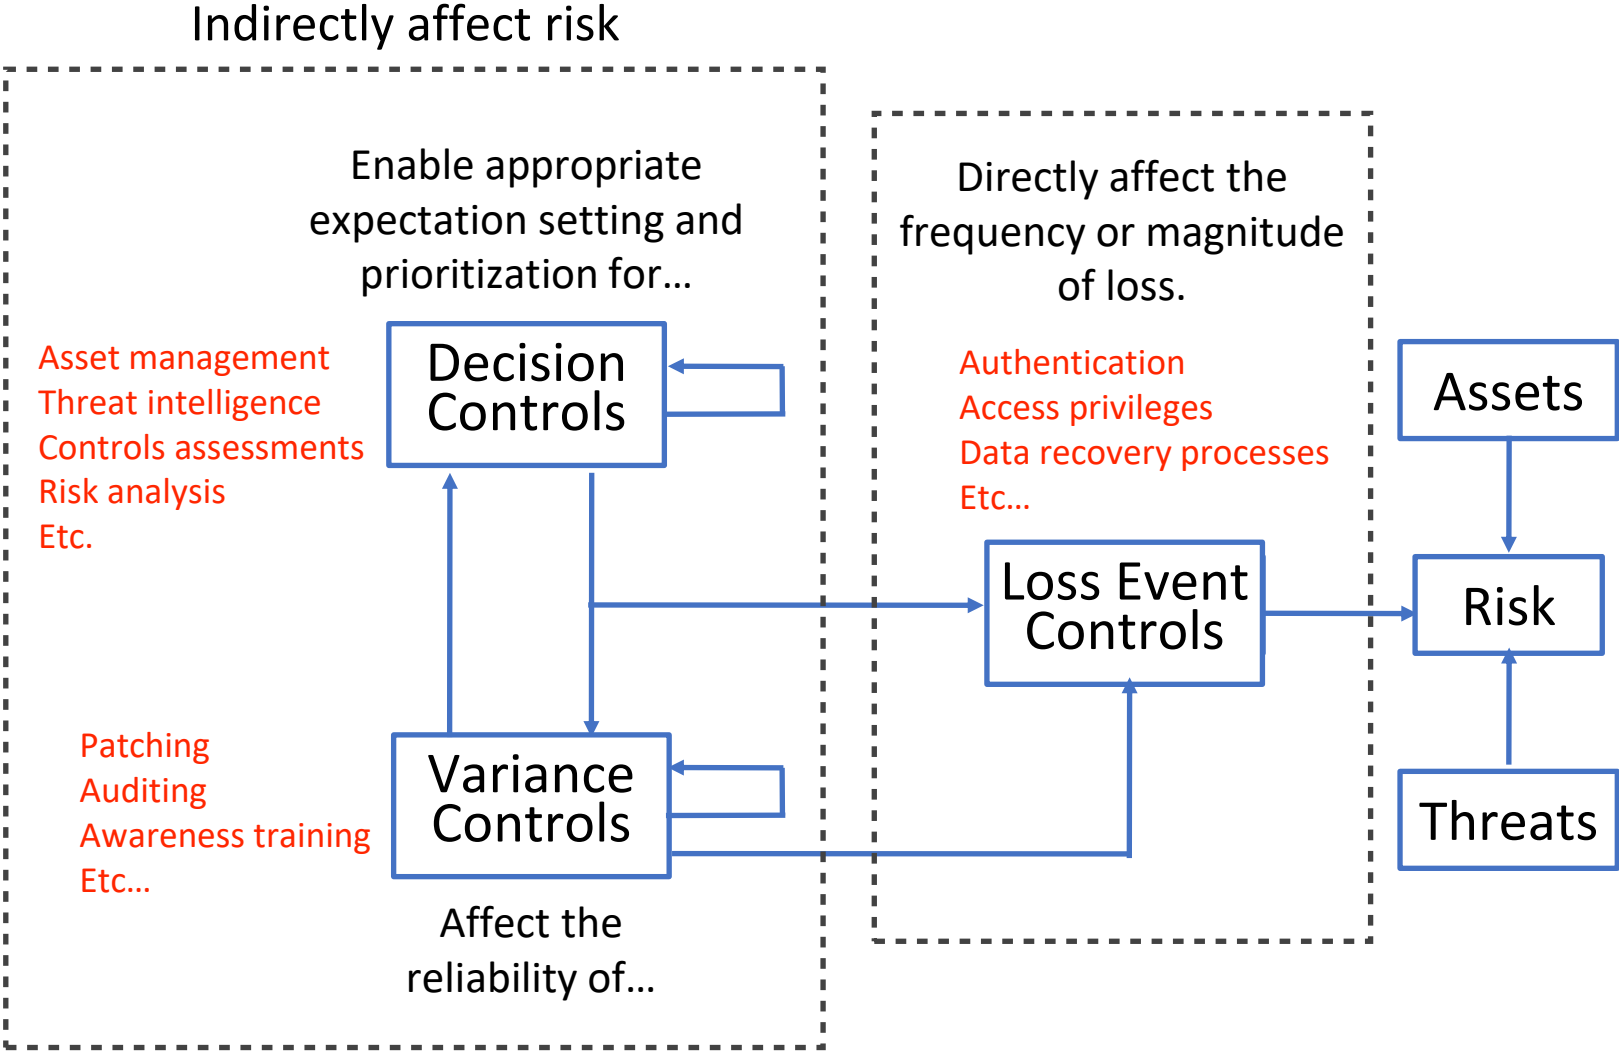

NOTES:

- NIST 800-53 mentions that controls are "related", but does not define the nature of the relationships.
- "Threat Kill Chain" analysis is somewhat similar in principle, but has a very narrow scope, focuses only on a subset of controls, and doesn't account for control relationships.

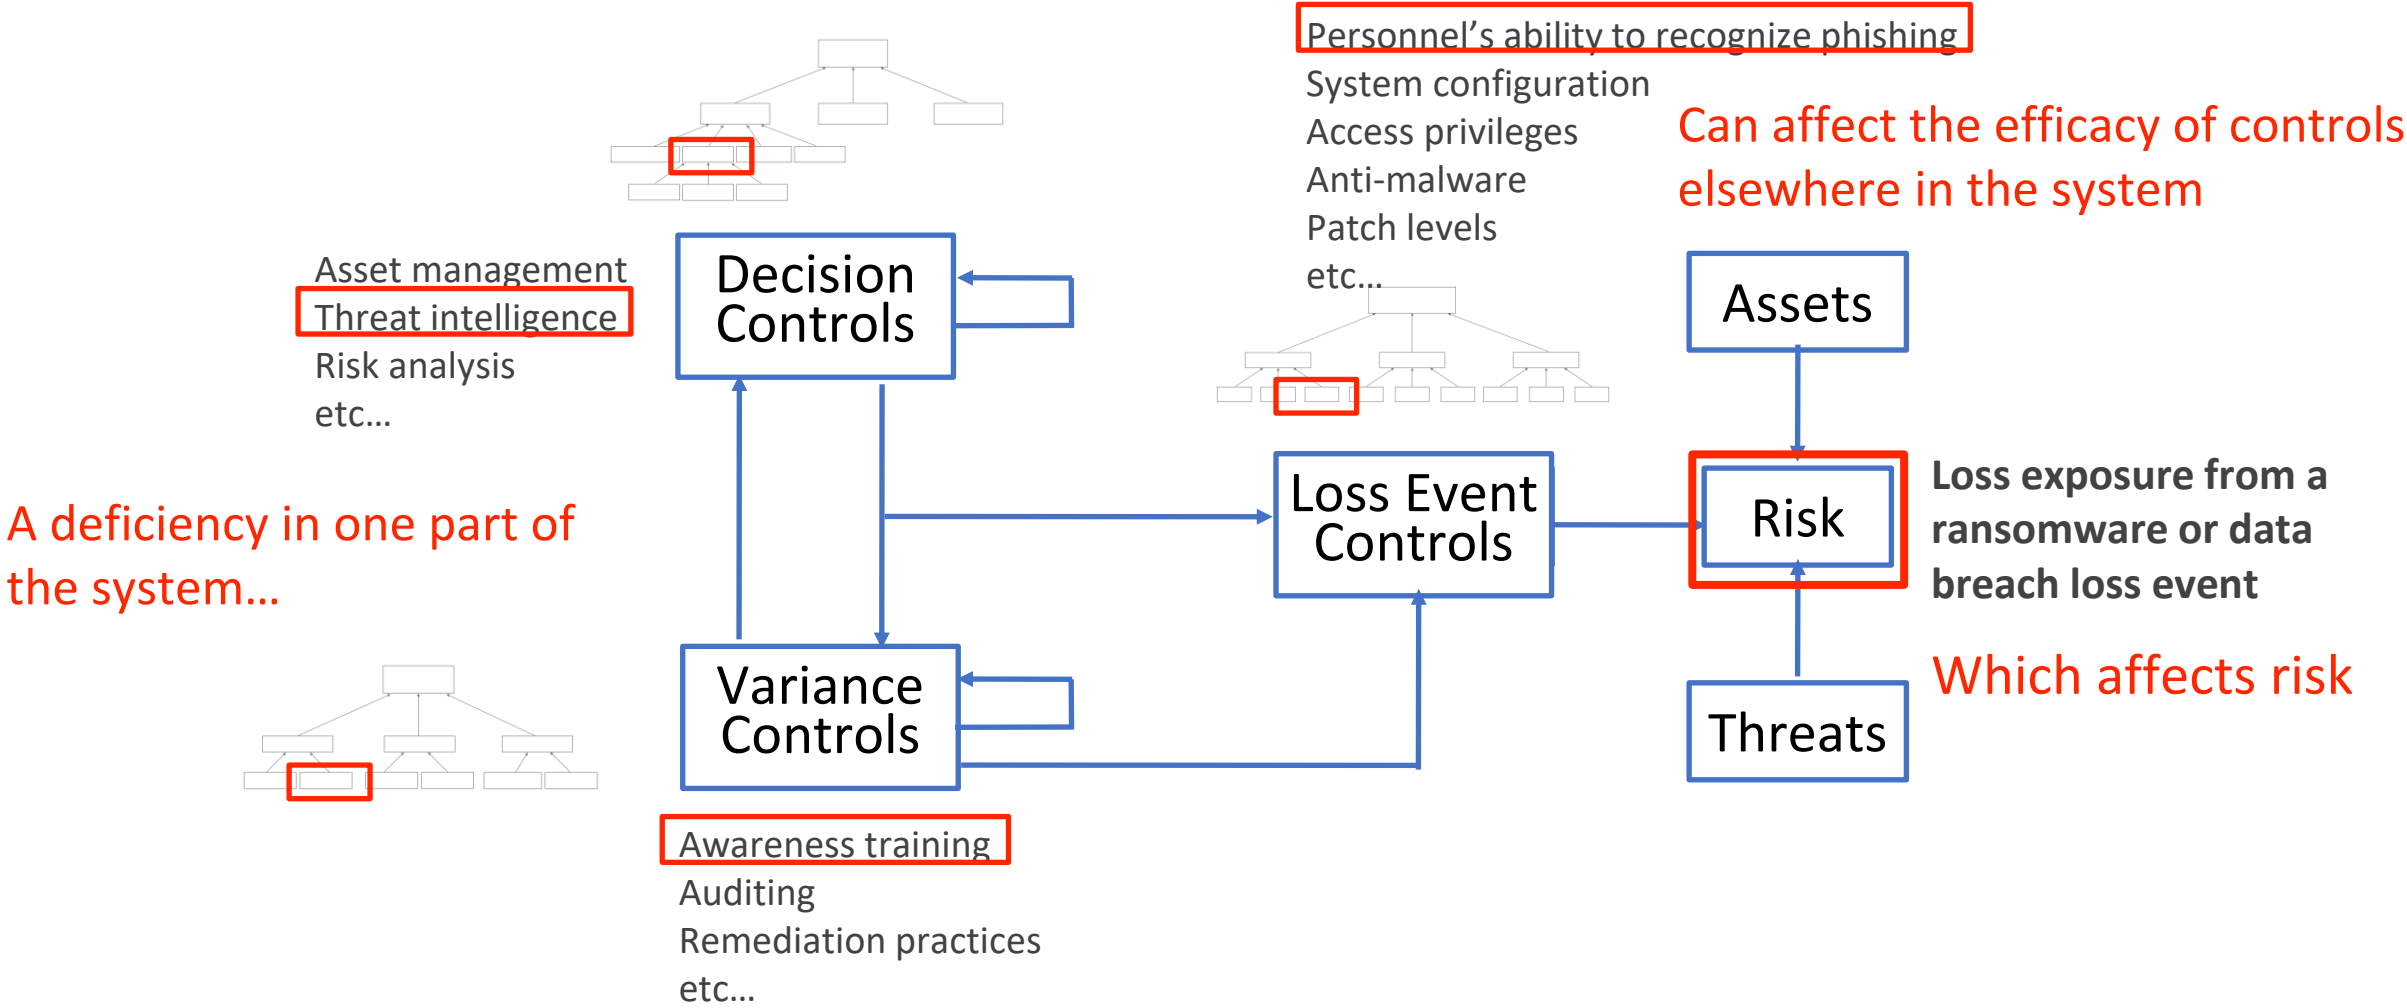

Control Functions (NIST CSF)

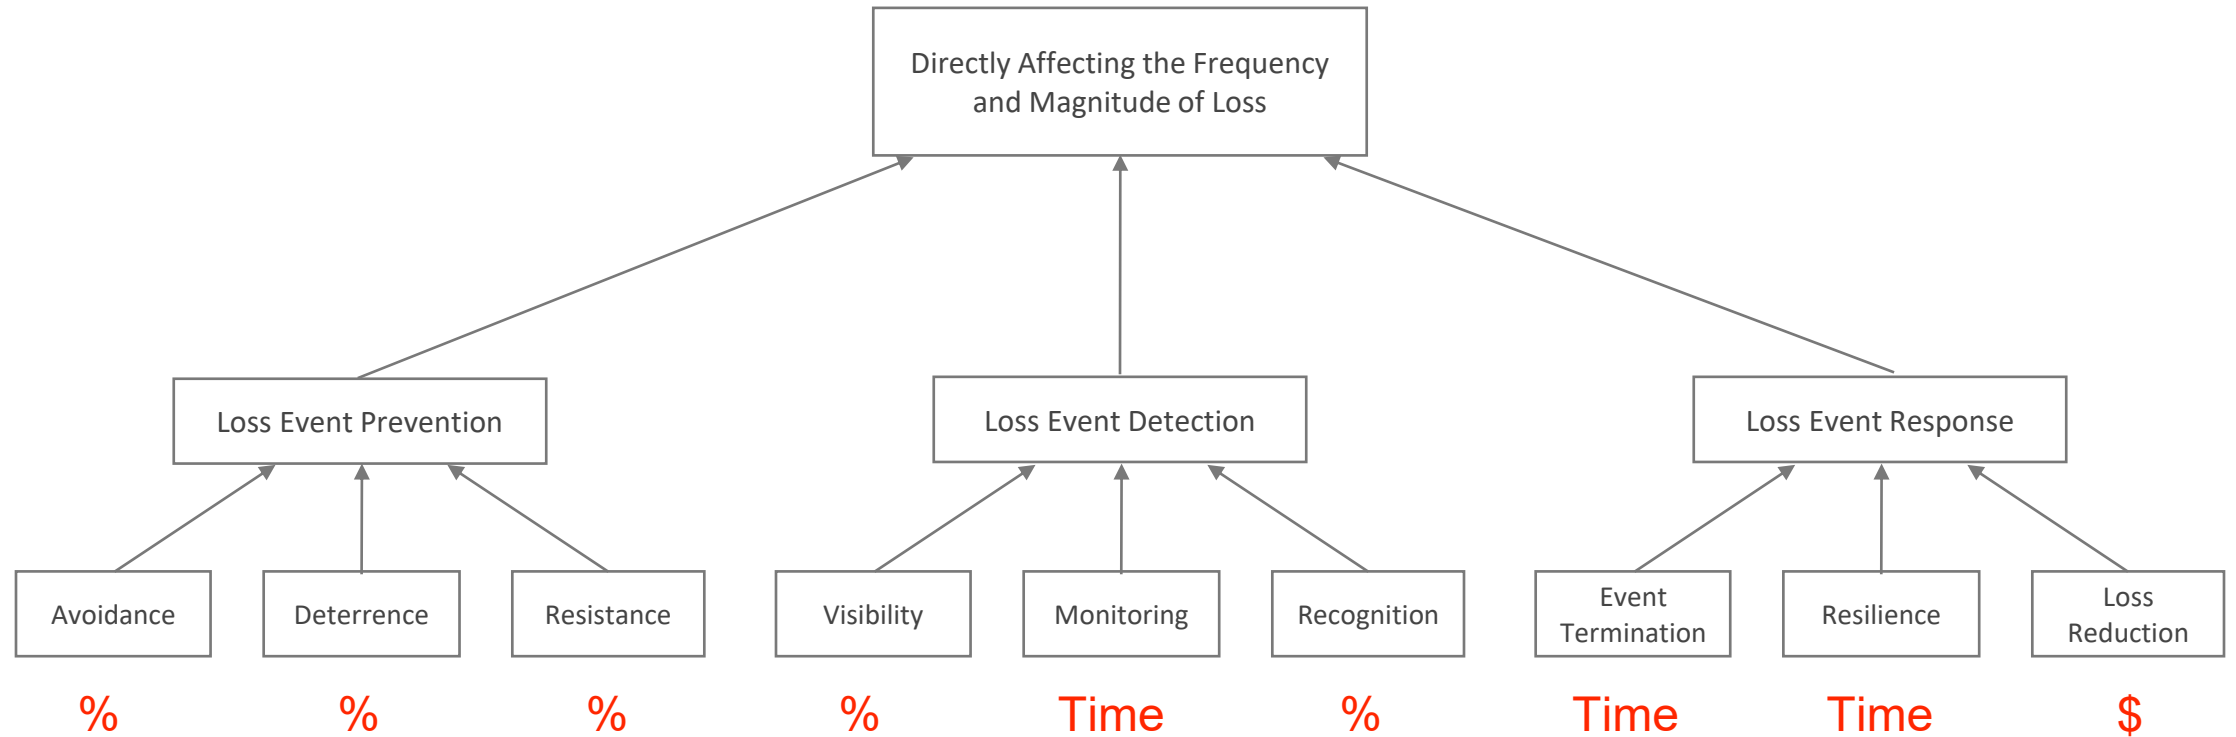

Control Functional Domain Relationships

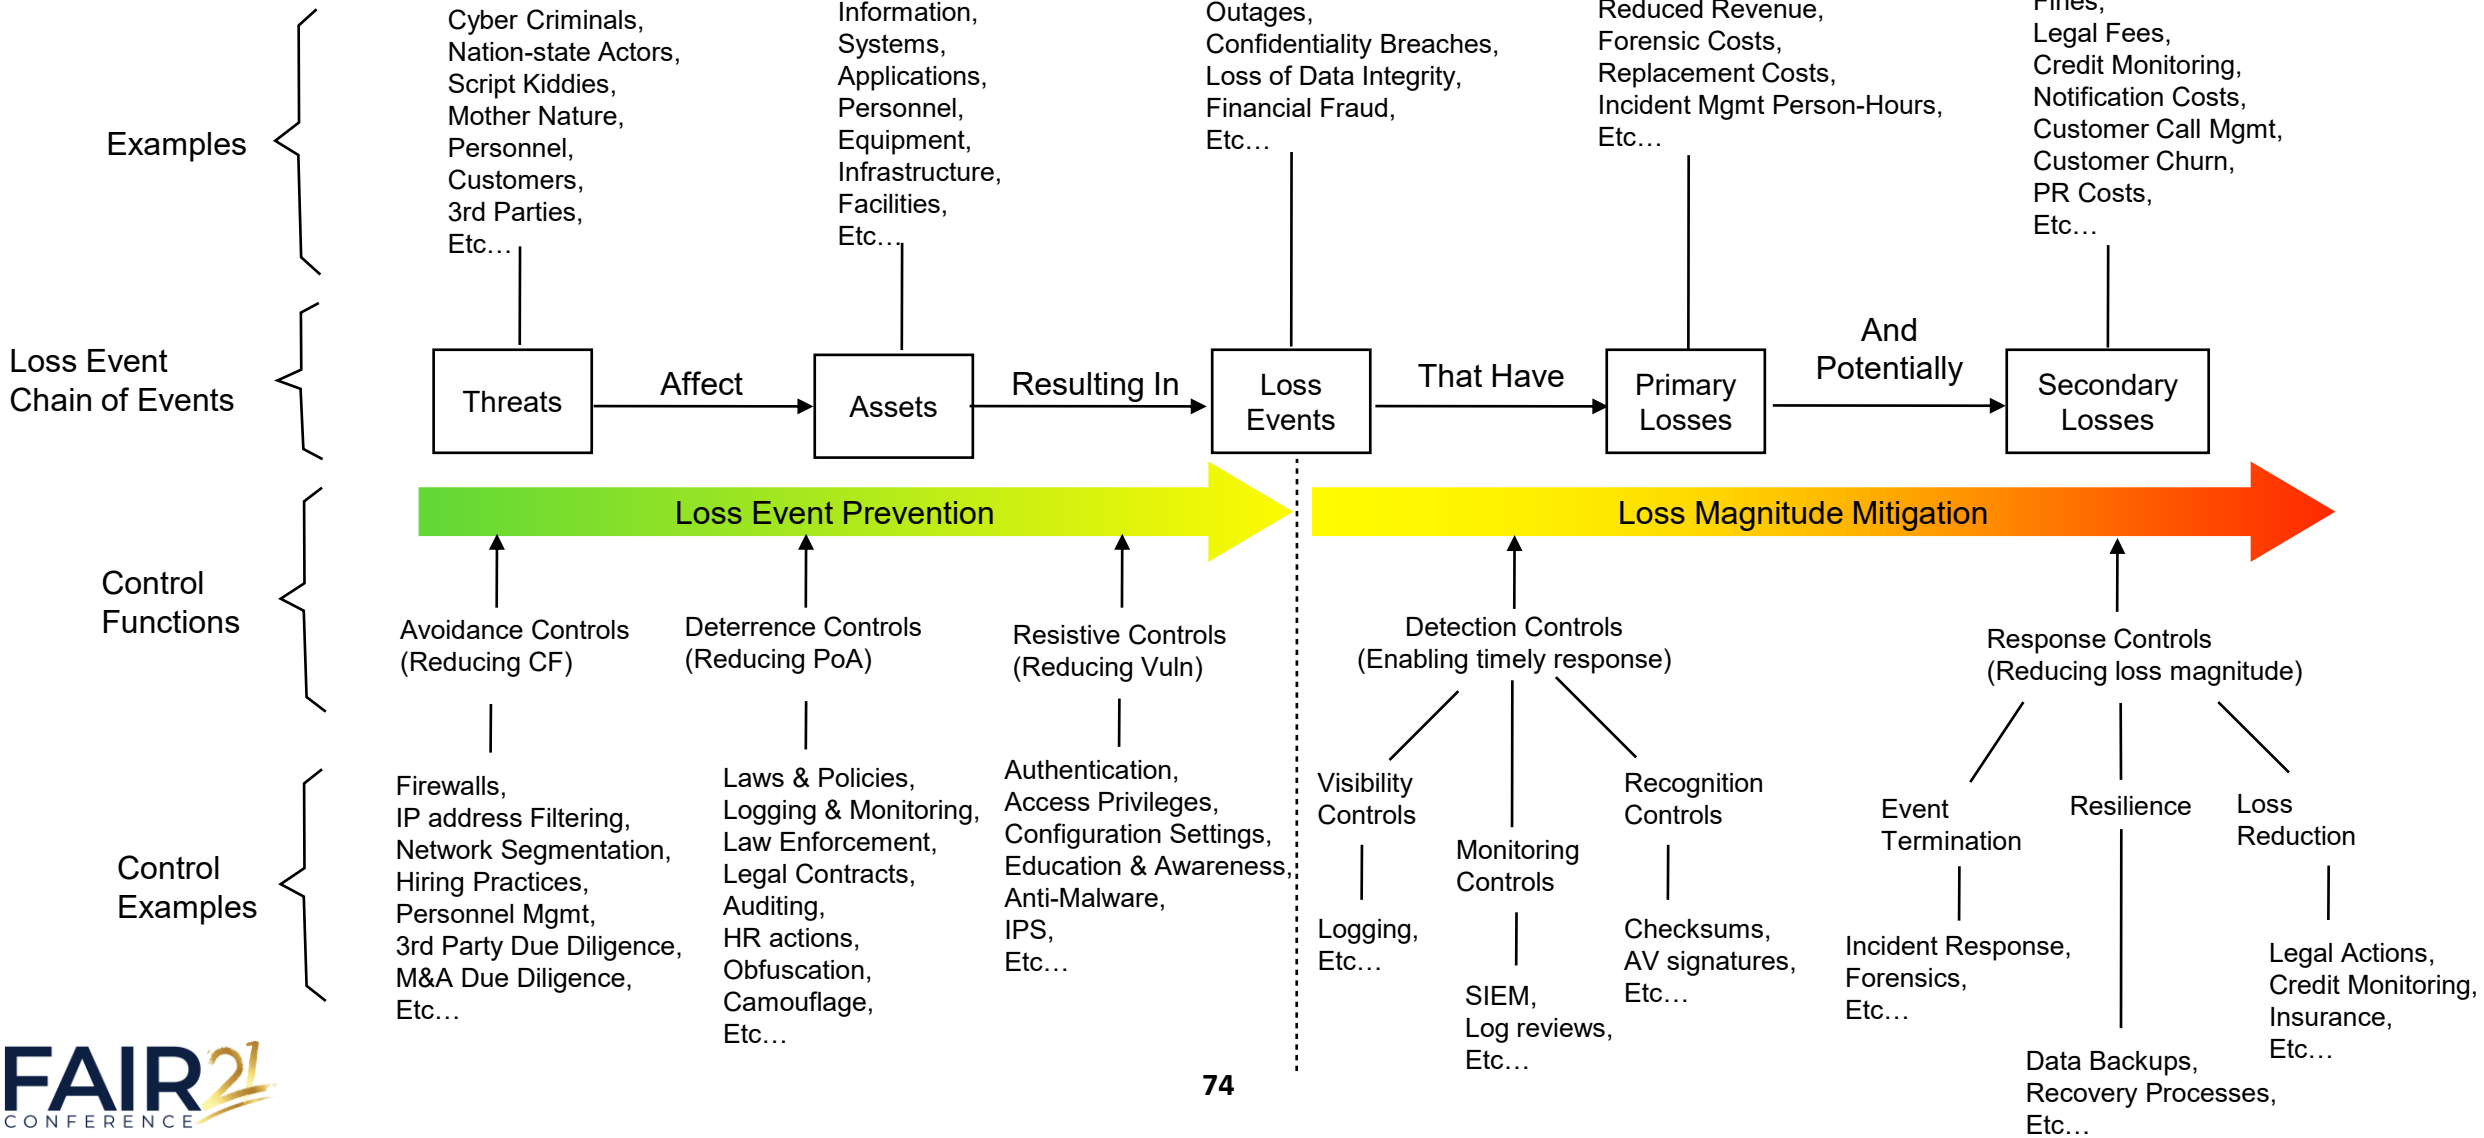

Control Functional Domain Relationships

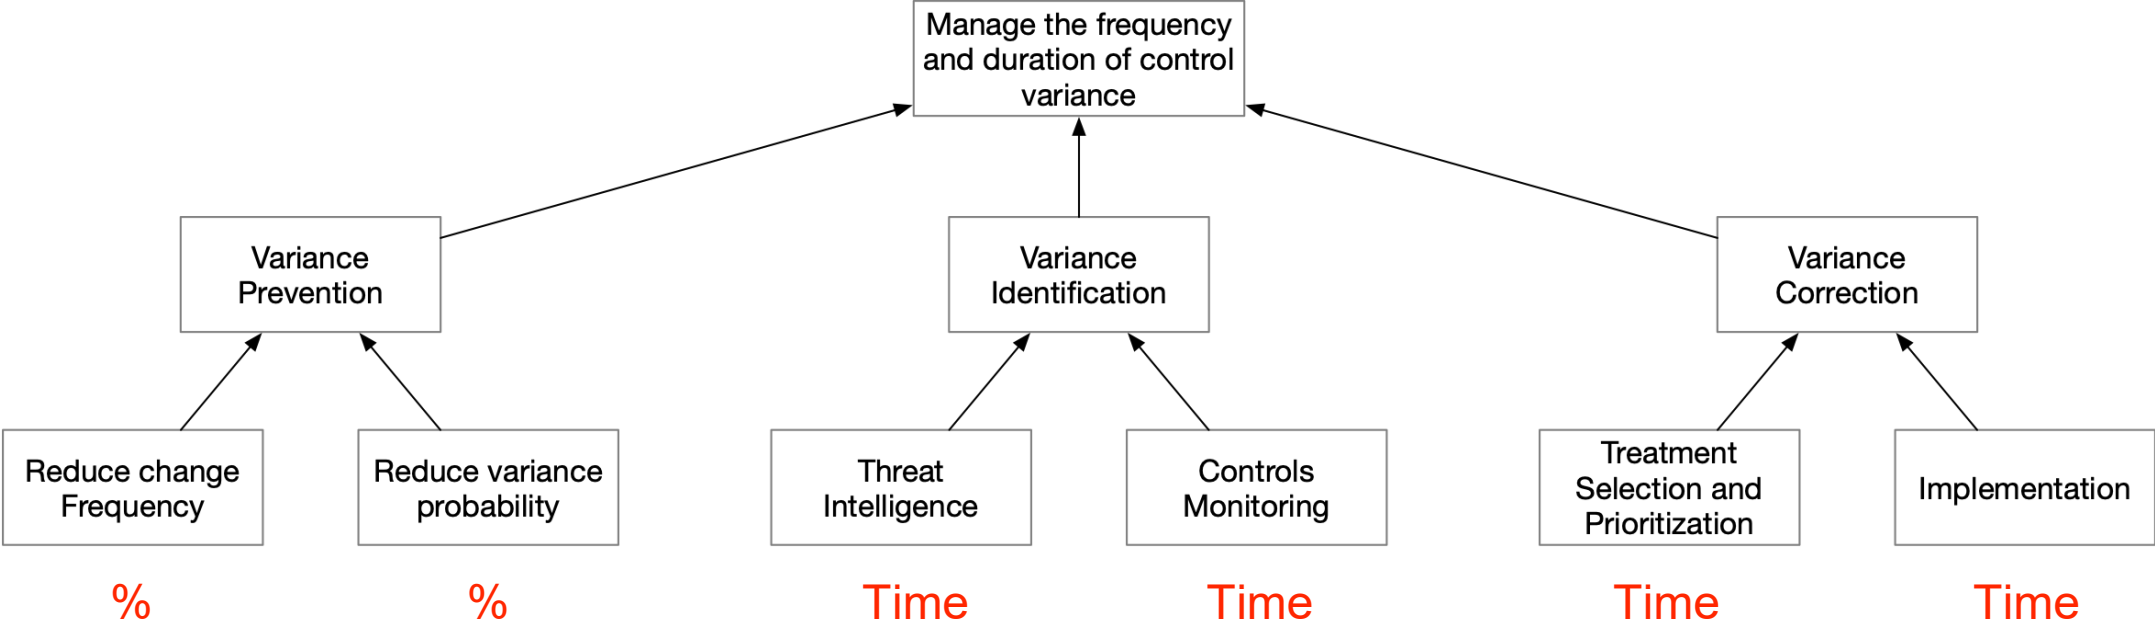

Loss Event Control Functions

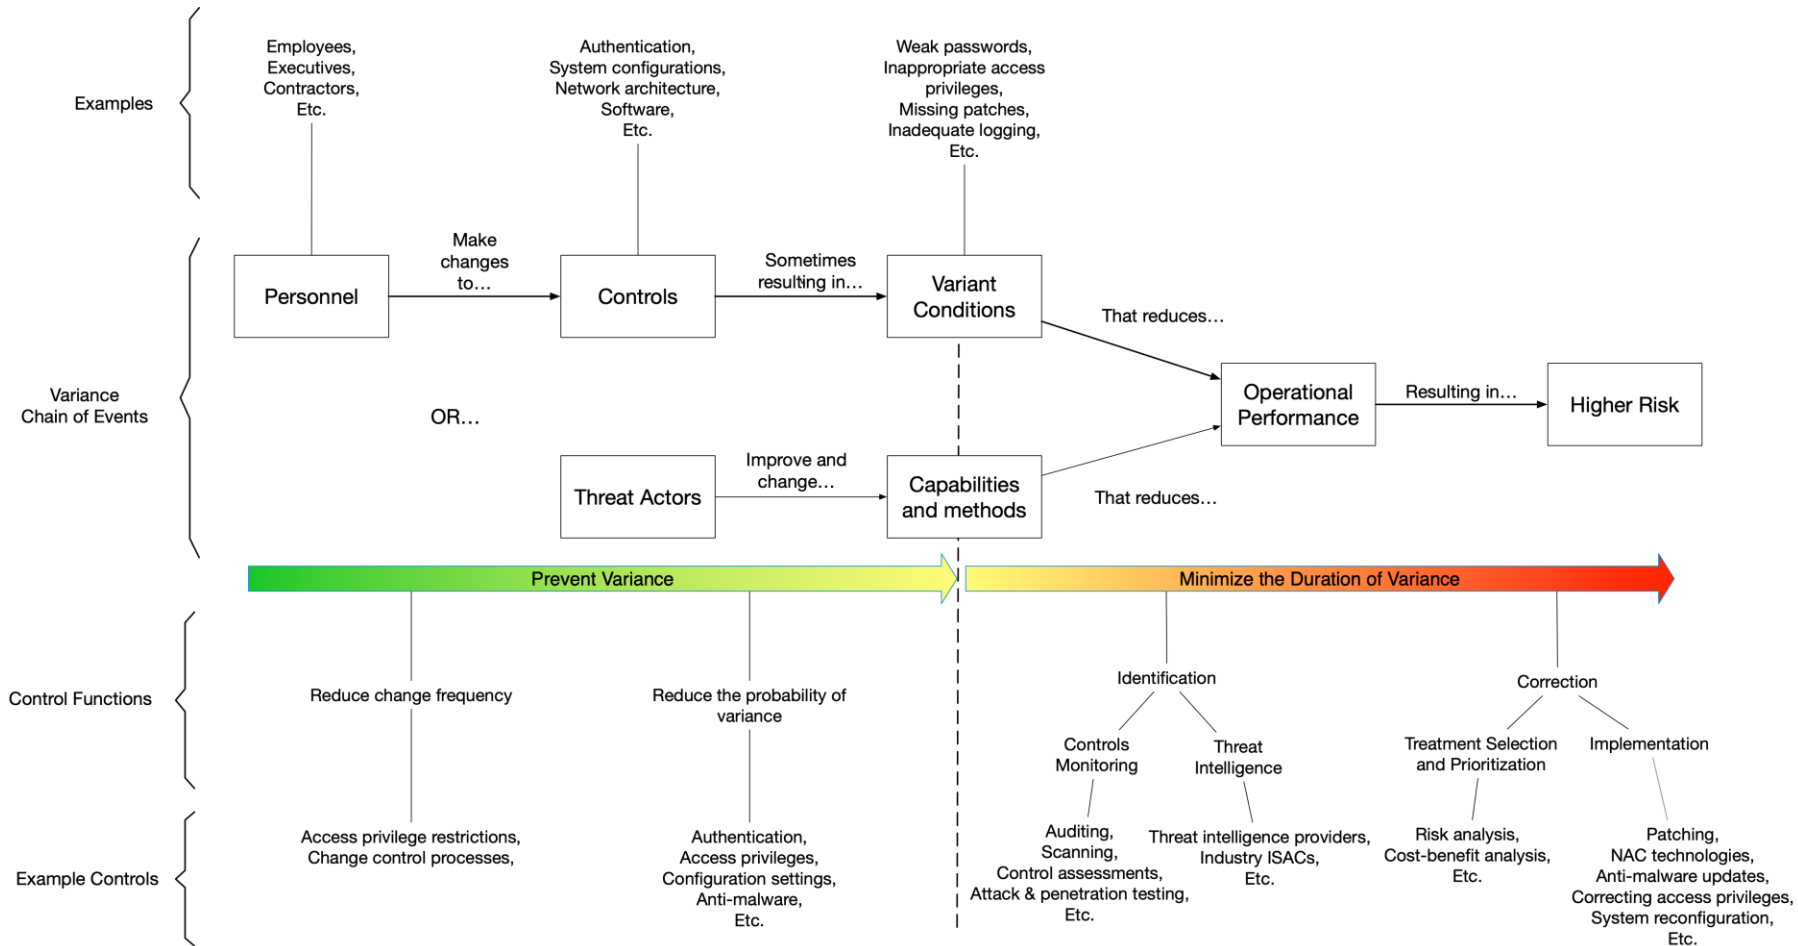

Loss Event Controls applied to risk

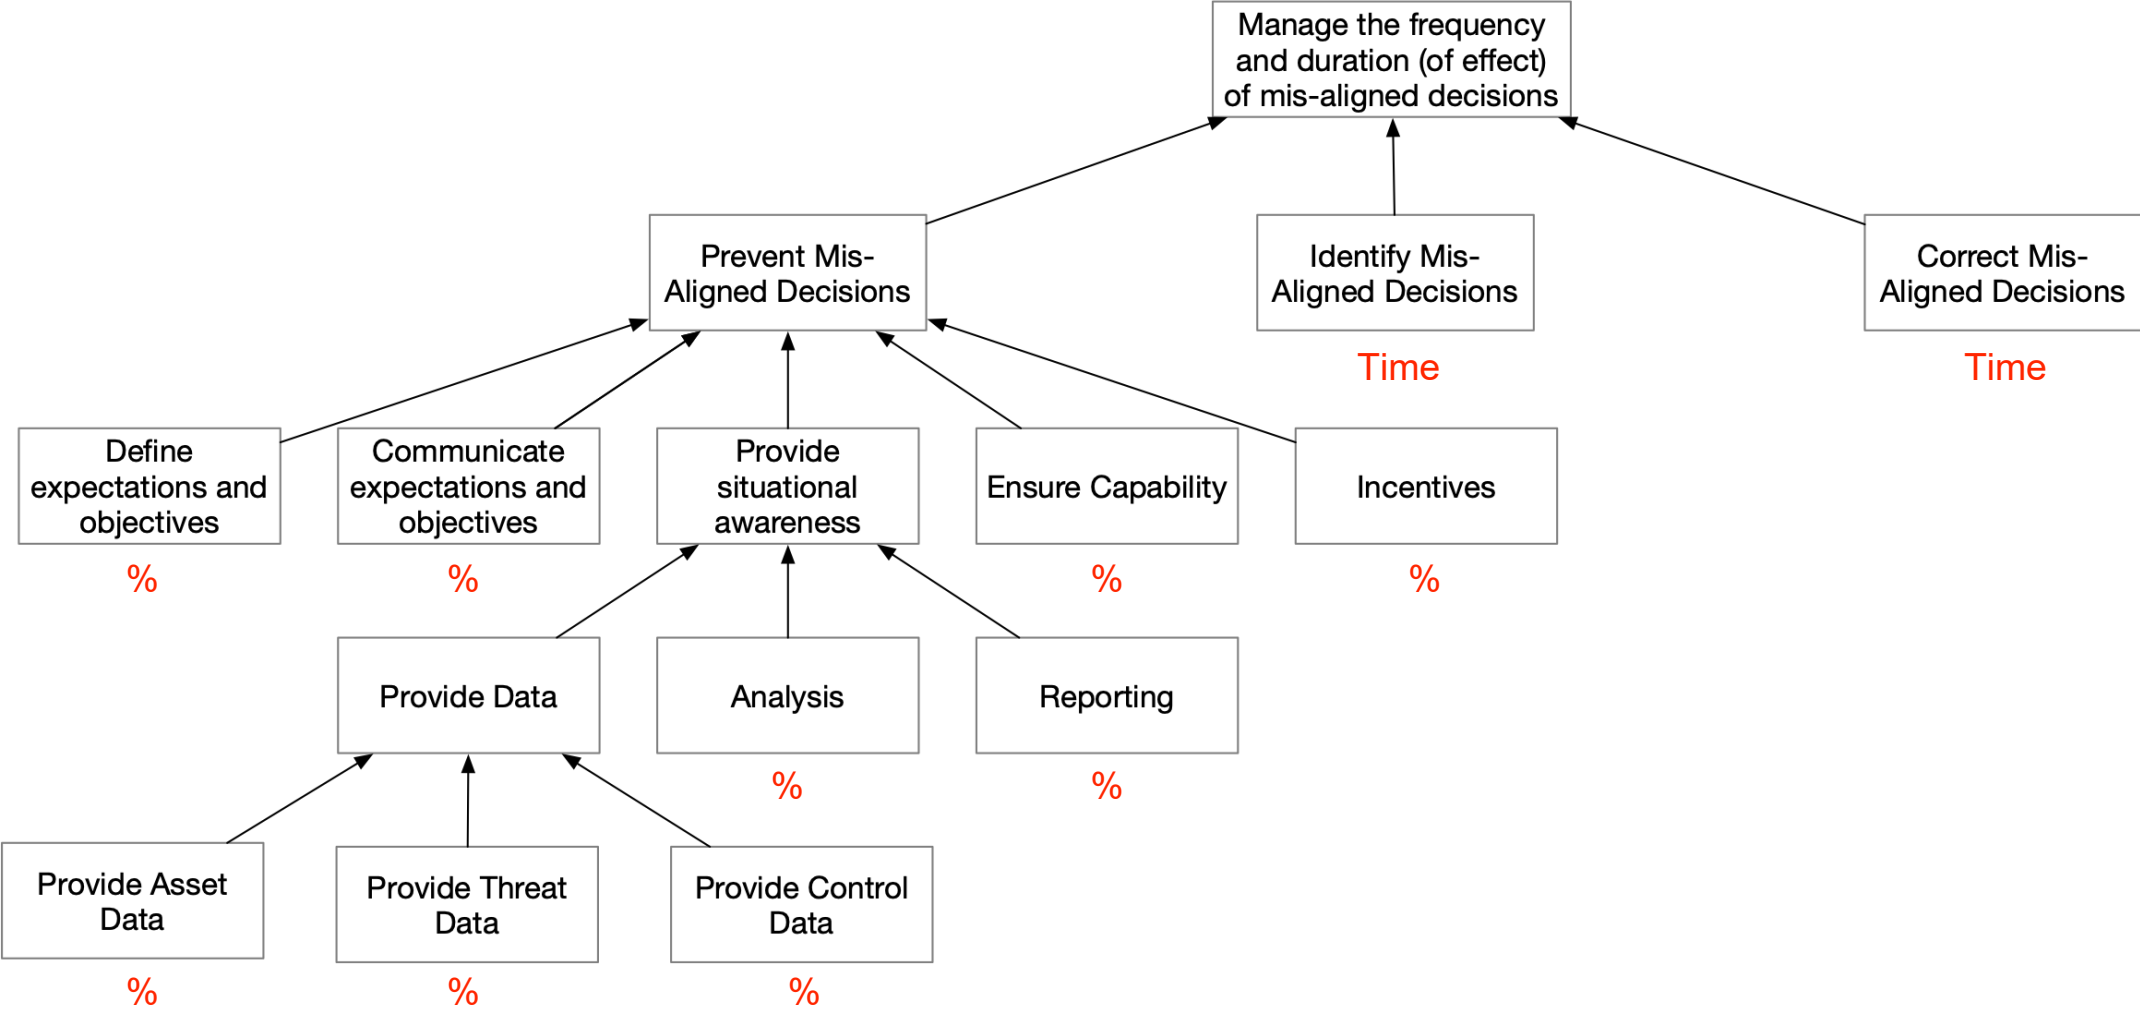

Variance Management Control (VMC) Functions

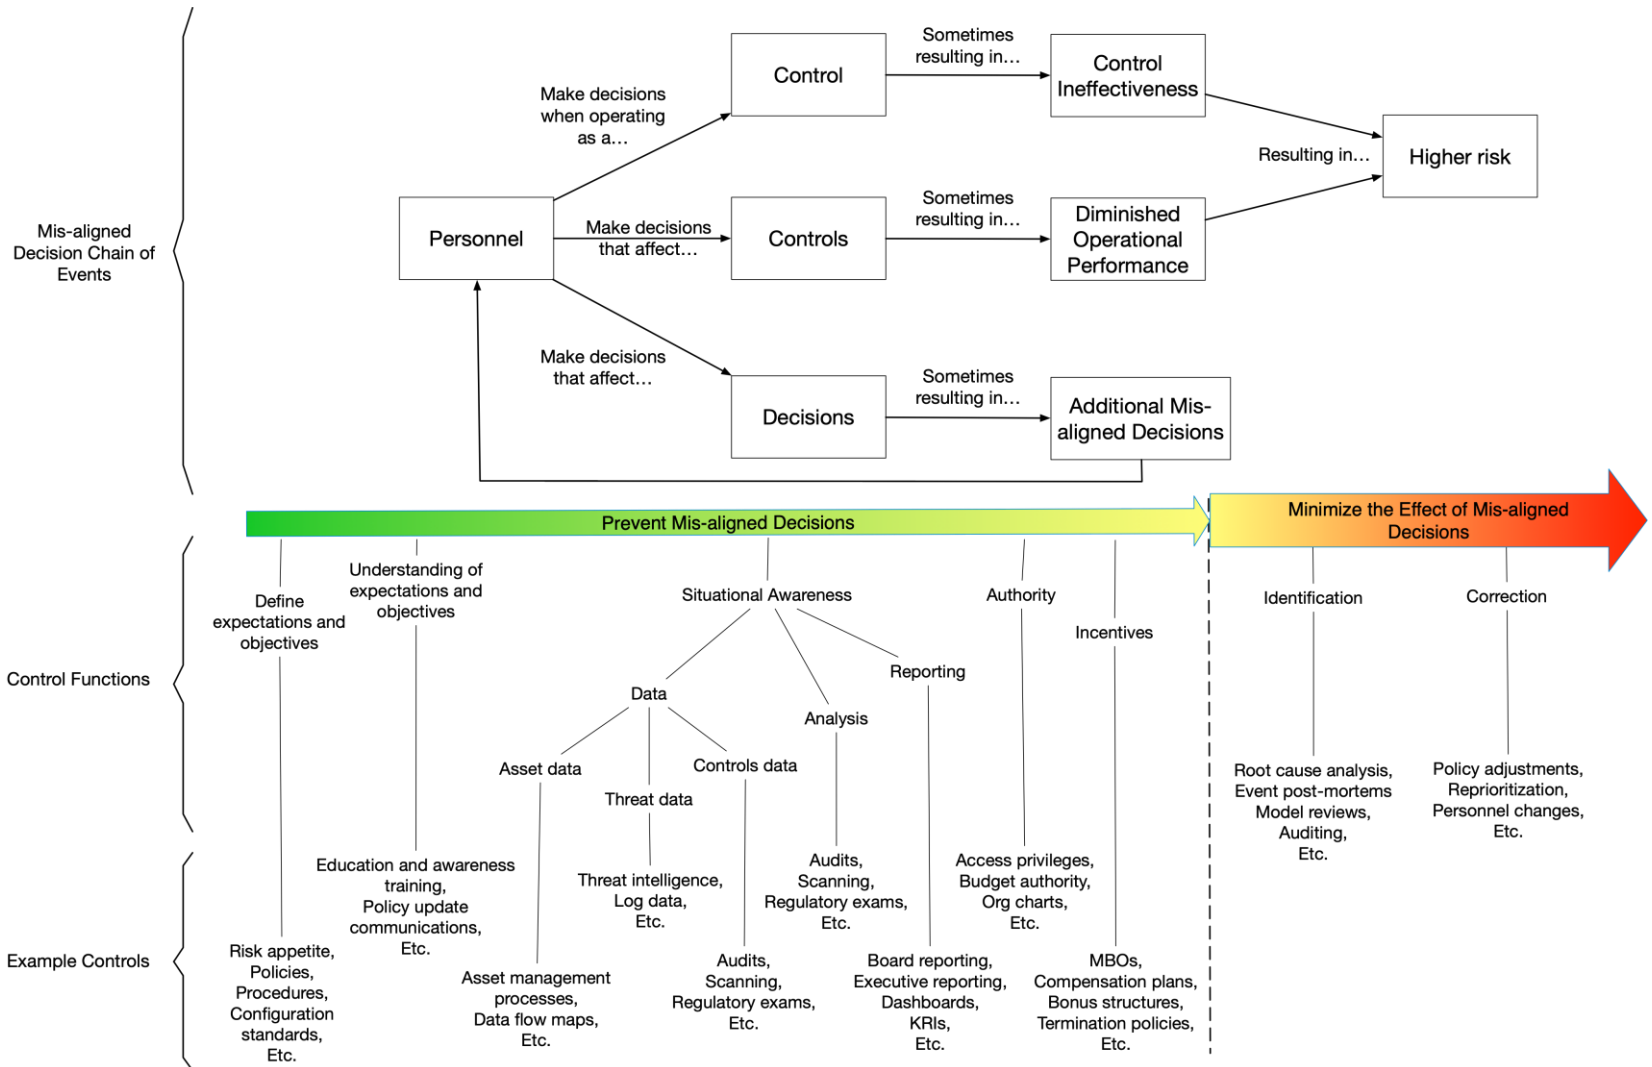

Variance Management Controls affect on risk

Decision Support Control (DSC) Functions

Decision Support Controls affect on risk

Combining controls “anatomy” with “physiology”

The objectives...

- Clarify how framework elements affect risk
- Make it easier to apply control frameworks within risk analysis
- Enable more reliable prioritization of control gaps
- Enable the refinement of control frameworks

Current mapping efforts...

- ISO27k
- CIS v8.0
- NIST 800-53
- HITRUST

Future mapping efforts...

- Mitre Att&ck
- COBIT
- PCI-DSS
- Others as requested

Wrapping up...

Summary

- Current control frameworks provide a view of control “anatomy” but rely on practitioner mental models to deal with “physiology”.
- As a result, we are unable to reliably measure or prioritize our control efforts.
- FAIR-CAM provides a “controls physiology” view, which complements existing frameworks and fills a critical gap in our ability to manage risk effectively.
- When FAIR-CAM is combined with FAIR, we can measure control value in real terms and reliably prioritize where and how we apply our resources.

“In the 19th century we had a relatively advanced understanding of anatomy, but we had a terrible understanding of physiology.

We knew what was happening, but we didn't know why it was happening.”

A retired surgeon

Questions?

MAPPING ISO/IEC 27001 TO FAIR CAM

Recipe

Ingredients:

- FAIR CAM
- ISO/IEC 27001:2013 controls
- Context / Scenario

Directives:

- Build a big spreadsheet
- Interpret controls and FAIR CAM definitions
- Bring your own expertise
- Review, review, review

????

THE FAIR CONTROLS ANALYTICS MODEL (FAIR-CAM) STANDARD

“How much risk a control reduces.”

- FAIR definition for risk — “The probable frequency and probable magnitude of future loss”
- Controls provide value by reducing either the frequency or magnitude of loss events.
- The FAIR Controls Analytics Model (FAIR-CAM) provides a rigorous description of how the risk management controls landscape works. It achieves this by describing the controls landscape as a **complex set of interdependent functions** that act as a **system** in the management of risk.

“How much risk a ISO/IEC 27001 control reduces.”

Credits:

“Control model introduction v1.1” by FAIR Institute

“Description of FAIR CAM standard v1” by FAIR Institute

“ISO/IEC 27001:2013” by International Standard Organization

“ISO/IEC 27002:2013” by International Standard Organization

THE FAIR CONTROLS ANALYTICS MODEL (FAIR-CAM) STANDARD

Some definitions

Control

“Anything that can be used to reduce the frequency or magnitude of loss.”

Laws, regulations, policies, standards, processes, technologies, people, software, physical structures, etc.

Control functions

“How a control directly or indirectly affects the frequency or magnitude of loss.”

Limiting, making, providing, restoring, reducing, detecting, etc.

Functional domains

“High-level categories of control functions”

Categories to distinguish between control functions that affect risk directly (**Loss Event Controls**), versus those that affect the operational performance of controls (**Variance Management Controls**), versus those that affect decision-making (**Decision Support Controls**).

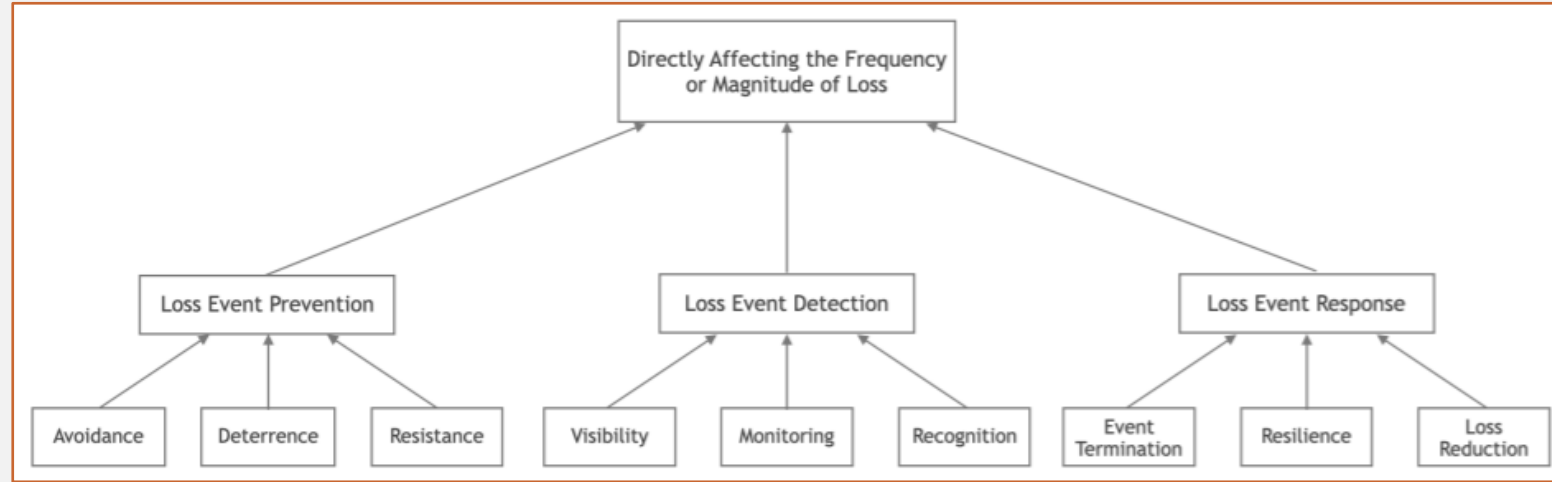

Function relationships

“How control functions relate to each others”

Boolean operators:
AND, OR.

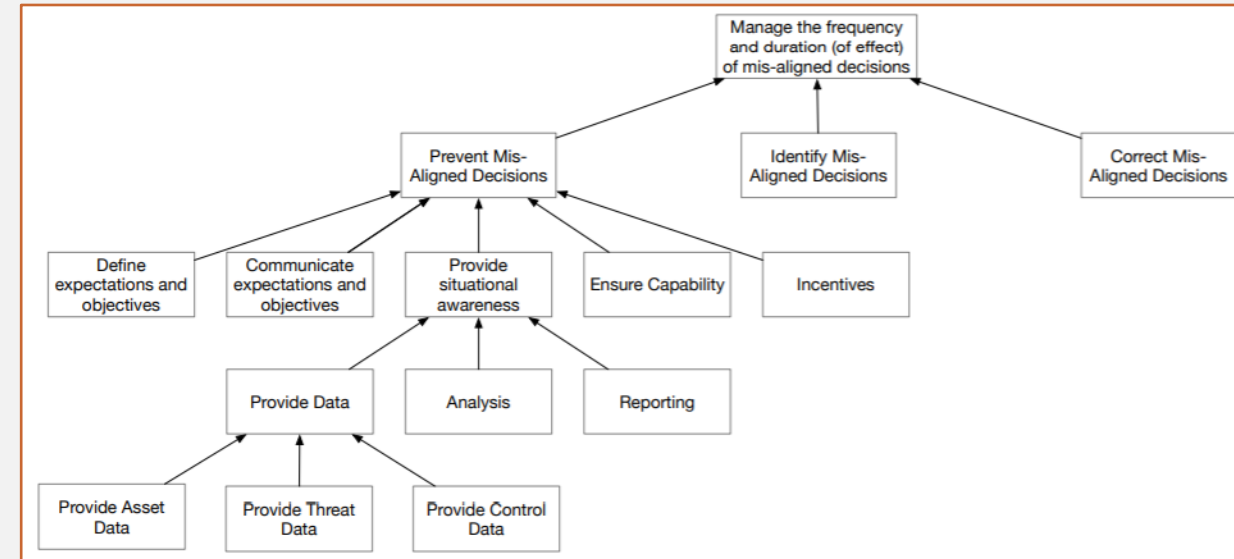

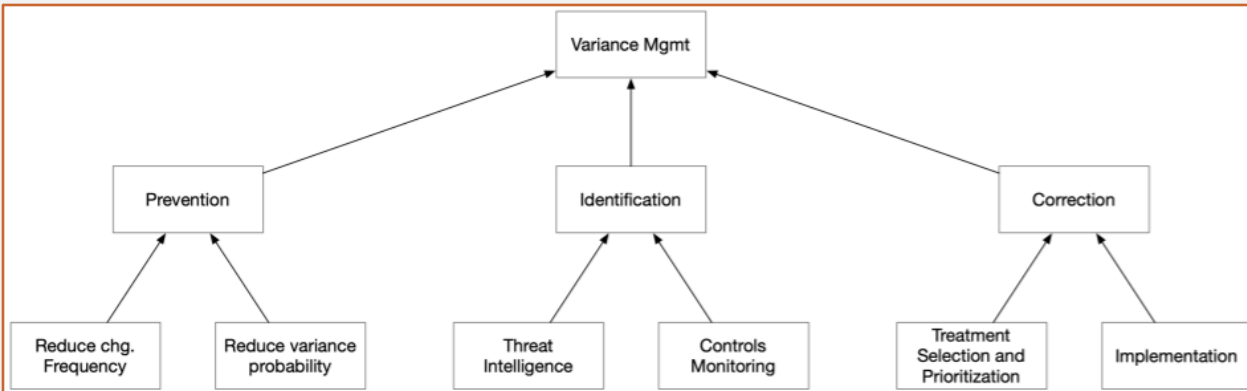

A simple example for OR relationships is the loss event prevention. If you can a) prevent contact with a threat agent, or b) deter action on the part of the threat agent, or c) successfully resist the actions of a threat agent, then a loss event will not occur.

Loss Event Controls

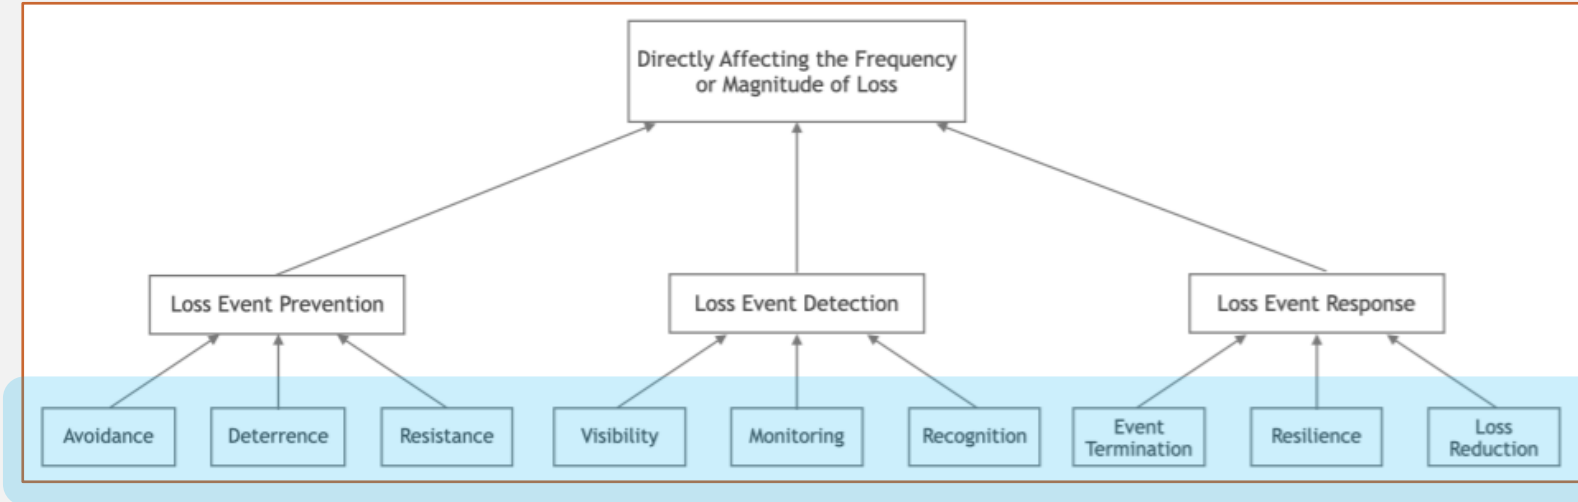

Variance Management Controls

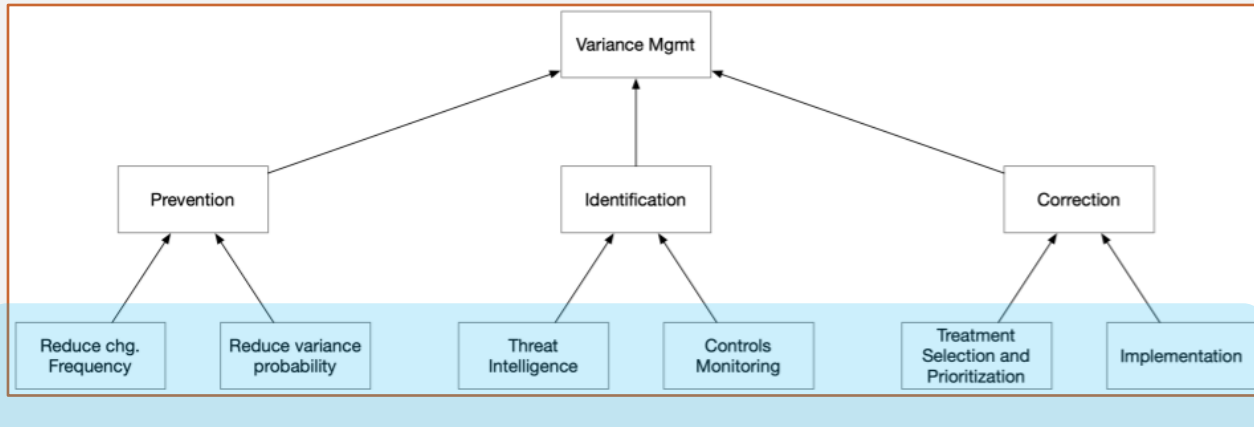

Decision Support Controls

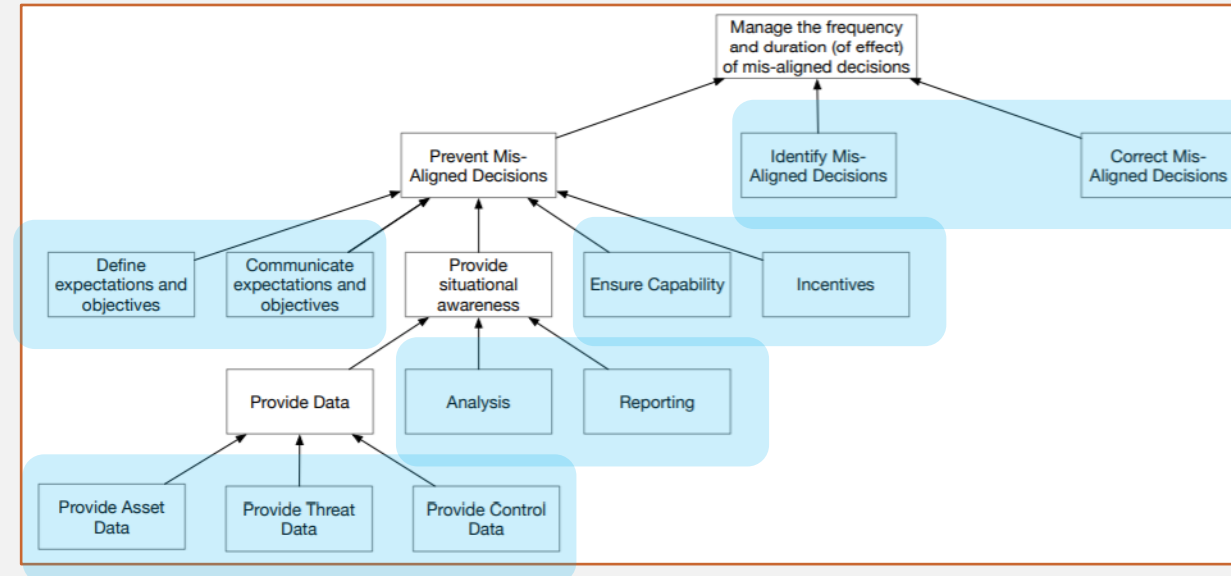

Loss Event Controls

Variance Management Controls

Decision Support Controls

ISO/IEC 27001:2013 CONTROLS

- ISO/IEC 27001 controls listed in Annex A (Reference control objectives) and detailed in ISO/IEC 27002 (Code of practice for information security controls)
- Total of 114 controls in the following domains:
 - Information security policies
 - Organization of information security
 - Human resources security
 - Asset management
 - Access control
 - Cryptography
 - Physical and environmental security
 - Operations security
 - Communications security
 - System acquisition, development and maintenance
 - Supplier relationships
 - Information security incident management
 - Information security aspects of business continuity management
 - Compliance

ISO/IEC 27001:2013 CONTROLS

- ISO/IEC 27001 controls listed in Annex A (Reference control objectives) and detailed in ISO/IEC 27002 (Code of practice for information security controls)
- Total of 114 controls in the following domains:
 - Information security policies
 - Organization of information security
 - Human resources security
 - Asset management
 - Access control
 - Cryptography
 - Physical and environmental security
 - Operations security
 - Communications security
 - System acquisition, development and maintenance

MAPPING EXAMPLE #1

Control 5.1.1 - Policies for information security

- A set of policies for information security should be defined, approved by management, published and communicated to employees and relevant external parties.

Implementation guidance

At the highest level, organizations should define an “information security policy” which is approved by management and which sets out the organization’s approach to managing its information security objectives.

Information security policies should address requirements created by:

- a) business strategy;
- b) regulations, legislation and contracts;
- c) the current and projected information security threat environment.

The information security policy should contain statements concerning:

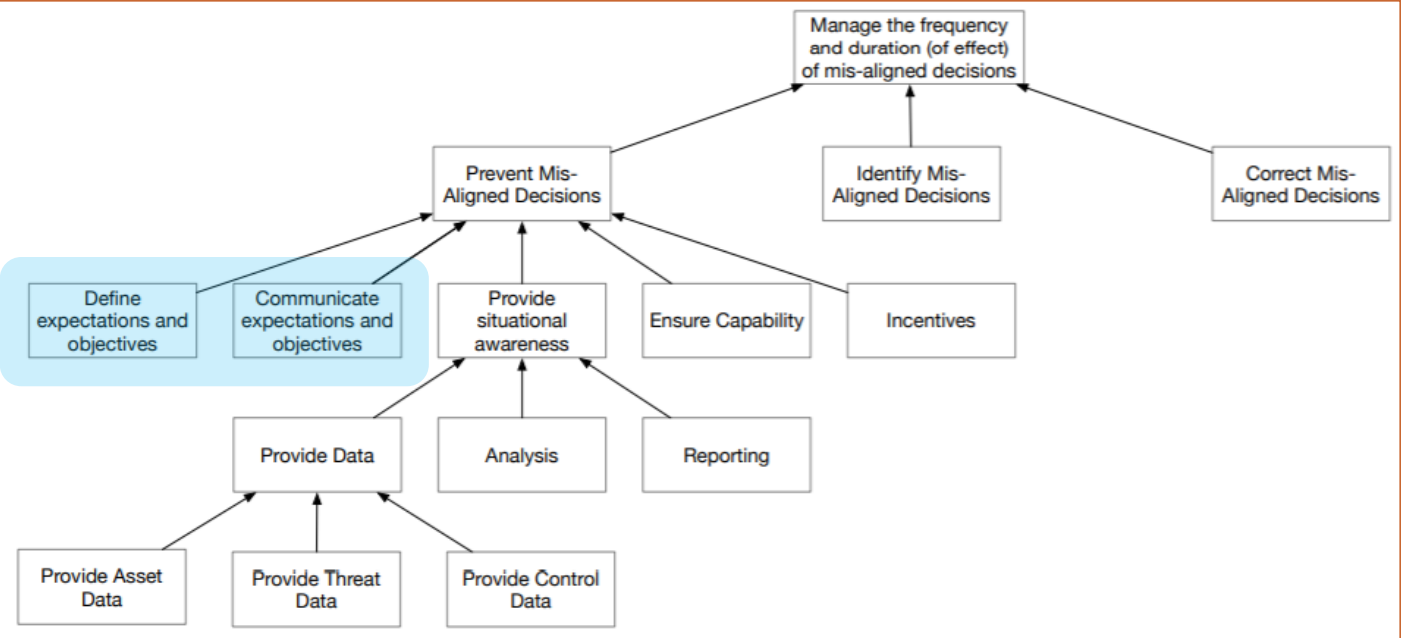

- a) definition of information security, objectives and principles to guide all activities relating to information security;
- b) assignment of general and specific responsibilities for information security management to defined roles;
- c) processes for handling deviations and exceptions.

These policies should be communicated to employees and relevant external parties in a form that is relevant, accessible and understandable to the intended reader, e.g. in the context of an “information security awareness, education and training programme.

MAPPING EXAMPLE #1

Control 5.1.1 - Policies for information security

Decision Support Controls

Define Expectations and Objectives
Clearly define expectations and/or objectives

Communicate expectations and objectives
Ensure that responsible persons are aware of and understand the organization’s risk management objectives and priorities.

MAPPING EXAMPLE #1

Control 5.1.1 - Policies for information security

| PROGR. | Ref # | Control Framework Elements | Decision Support Control | | | | | |
|--------|--------|---|--------------------------|---------------------------|------------------------------|--|----------|--|
| | | | Prevention | | | | | |
| | | | Define Exp's & Obj's | Communicate Exp's & Obj's | Ensure Situational Awareness | | | |
| | | | | | Data | | Analysis | |
| Asset | Threat | Controls | | | | | | |
| | 5 | Information security policies | | | | | | |
| | 5.1 | Management direction for information security | | | | | | |
| 1 | 5.1.1 | Policies for information security | X | X | | | | |

MAPPING EXAMPLE #2

Control 7.2.2 - Information security awareness, education and training

- All employees of the organization and, where relevant, contractors should receive appropriate awareness education and training and regular updates in organizational policies and procedures, as relevant for their job function.

Implementation guidance

An information security awareness programme should aim to make employees and, where relevant, contractors aware of their responsibilities for information security and the means by which those responsibilities are discharged.

An information security awareness programme should be established in line with the organization's information security policies and relevant procedures, taking into consideration the organization's information to be protected and the controls that have been implemented to protect the information.

The awareness programme should include a number of awareness-raising activities such as campaigns (e.g. an "information security day") and issuing booklets or newsletters.

The awareness programme should be planned taking into consideration the employees' roles in the organization, and, where relevant, the organization's expectation of the awareness of contractors. The activities in the awareness programme should be scheduled over time, preferably regularly, so that the activities are repeated and cover new employees and contractors. The awareness programme should also be updated regularly so it stays in line with organizational policies and procedures, and should be built on lessons learnt from information security incidents.

Awareness training should be performed as required by the organization's information security awareness programme. Awareness training can use different delivery media including classroom-based, distance learning, web-based, self-paced and others. **[etc.]**

MAPPING EXAMPLE #2

Control 7.2.2 - Information security awareness, education and training

Loss Event Controls

Resistance

Reduce the likelihood that a threat agent's act will result in a loss event.

Recognition

Enable differentiation of normal activity from abnormal activity.

Variance Management Controls

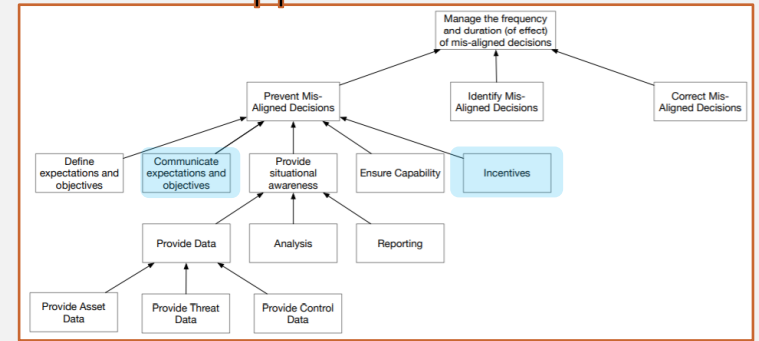

Reduce change frequency

Reduce the frequency of changes that might introduce variant control conditions.

Reduce variance probability

Enable the recognition of changes in the threat landscape that have resulted in loss event controls no longer being as effective as intended.

Decision Support Controls

Communicate expectations and objectives

Ensure that responsible persons are aware of and understand the organization's risk management objectives and priorities.

Incentives

Ensure that personnel are motivated on a personal level to make decisions that are aligned with the organization's expectations and objectives.

MAPPING EXAMPLE #2

Control 7.2.2 - Information security awareness, education and training

| Control Framework Elements | Loss Event Control Functions | | | | | | | | | Variance Management Control Functions | | | | | Decision Support Control Functions | | | | | | | | |
|--|------------------------------|------------|------------|------------|------------|-------------|-------------|------------|----------------|---------------------------------------|-----------------|----------------|---------------------|----------------------------|------------------------------------|---------------------------|------------------------------|-------|-------------|----------|-------------------|------------|----------|

MAPPING EXAMPLE #2

Control 7.2.2 - Information security awareness, education and training

| Control Framework Elements | Loss Event Control Functions | | | | | | | | | Variance Management Control Functions | | | | Decision Support Control Functions | | | | | | | | | | |
|--|------------------------------|------------|------------|------------|------------|-------------|-------------|------------|----------------|---------------------------------------|-----------------|----------------|---------------------|------------------------------------|----------------|----------------------|---------------------------|------------------------------|-------------|----------|-------------------|------------|--|---|
| | Prevention | | | Detection | | | Response | | | Prevention | | Identification | | Correction | | Prevention | | | | | | | | |
| | Avoidance | Deterrence | Resistance | Visibility | Monitoring | Recognition | Containment | Resilience | Loss Reduction | Reduce Chg Freq | Reduce Var Prob | Threat Intel | Controls Monitoring | Selection & Prioritization | Implementation | Define Exp's & Obj's | Communicate Exp's & Obj's | Ensure Situational Awareness | | | Ensure Capability | Incentives | | |
| | | | | | | | | | | | | | | | | | | Asset | Data Threat | Controls | Analysis | Reporting | | |
| Information security awareness, education and training | | | X | | | X | | | | X | X | | | | | | X | | | | | | | X |

Some observations

- The mapping is one-to-many
- The mapping is subject to the interpretation of the ISO/IEC 27001 control (it tells what but not how!)
- The mapping is subject to the interpretation of the FAIR CAM control functions' definitions
- Personal experience and expertise may influence the mapping

MAPPING EXAMPLE #3

Control 6.2.2 - Teleworking

- A policy and supporting security measures should be implemented to protect information accessed, processed or stored at teleworking sites.

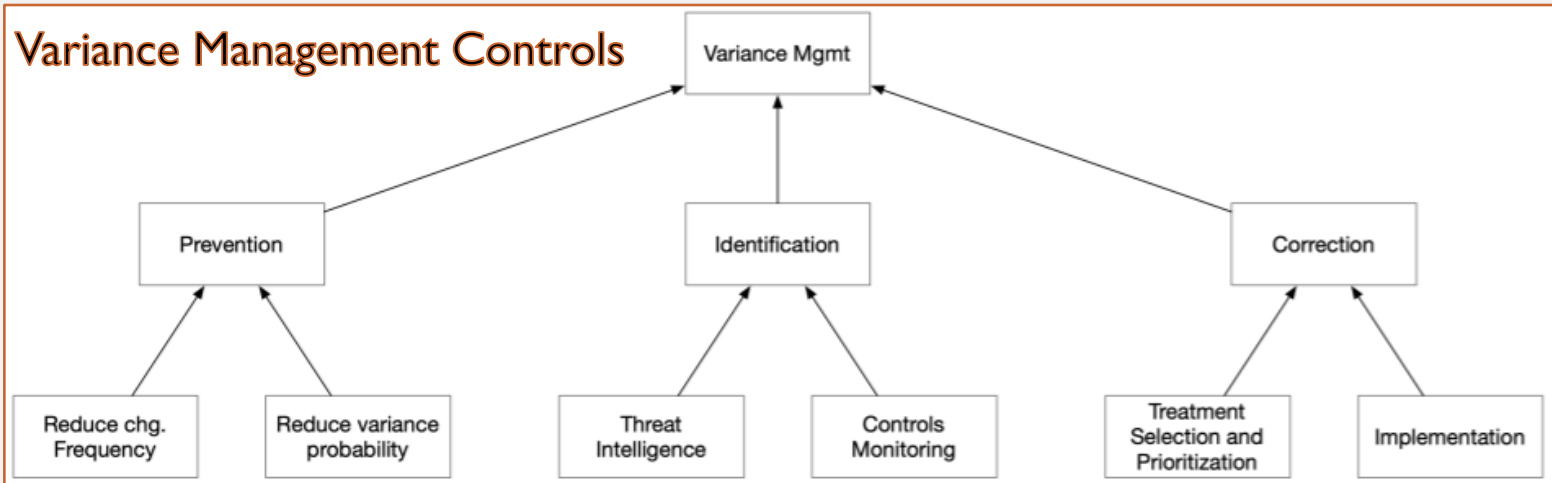

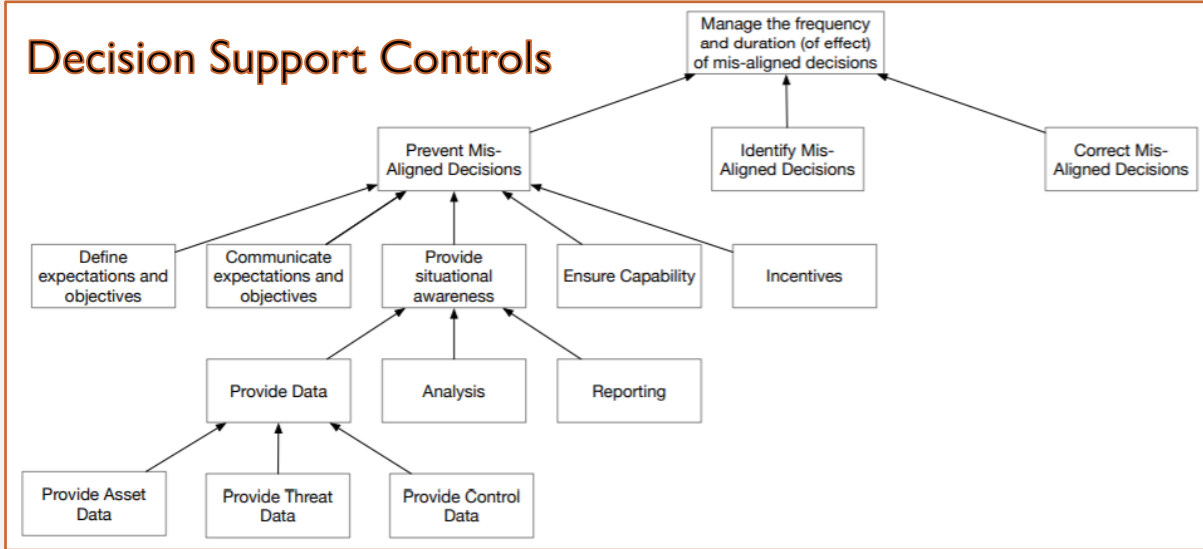

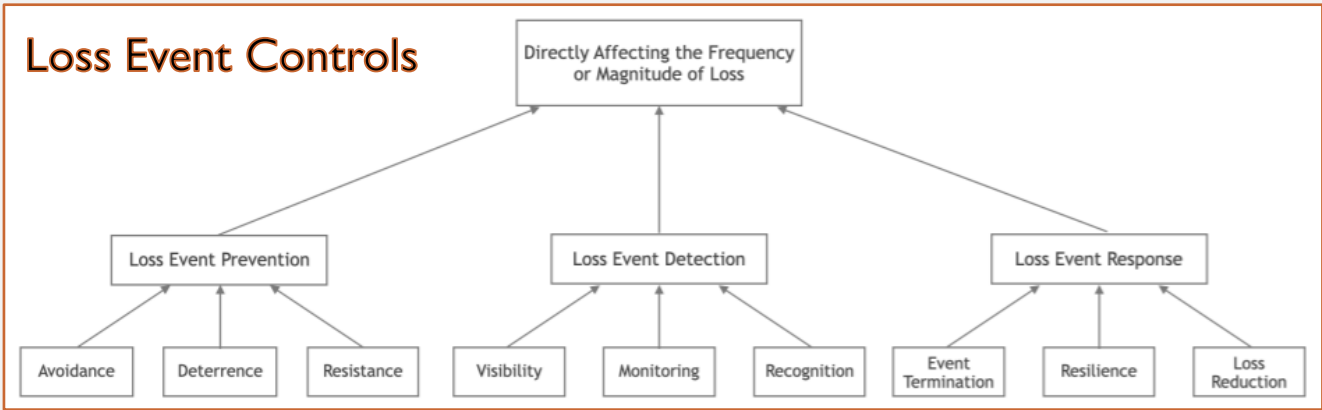

Implementation guidance

Organizations allowing teleworking activities should issue a policy that defines the conditions and restrictions for using teleworking. Where deemed applicable and allowed by law, the following matters should be considered:

- a) the existing physical security of the teleworking site, taking into account the physical security of the building and the local environment;
- b) the proposed physical teleworking environment;
- c) the communications security requirements, taking into account the need for remote access to the organization's internal systems, the sensitivity of the information that will be accessed and passed over the communication link and the sensitivity of the internal system;
- d) the provision of virtual desktop access that prevents processing and storage of information on privately owned equipment;
- e) the threat of unauthorized access to information or resources from other persons using the accommodation, e.g. family and friends;
- f) the use of home networks and requirements or restrictions on the configuration of wireless network services;
- g) policies and procedures to prevent disputes concerning rights to intellectual property developed on privately owned equipment;
- h) access to privately owned equipment (to verify the security of the machine or during an investigation), which may be prevented by legislation;
- i) software licensing agreements that are such that organizations may become liable for licensing for client software on workstations owned privately by employees or external party users;
- j) malware protection and firewall requirements. **[etc.]**

MAPPING EXAMPLE #3

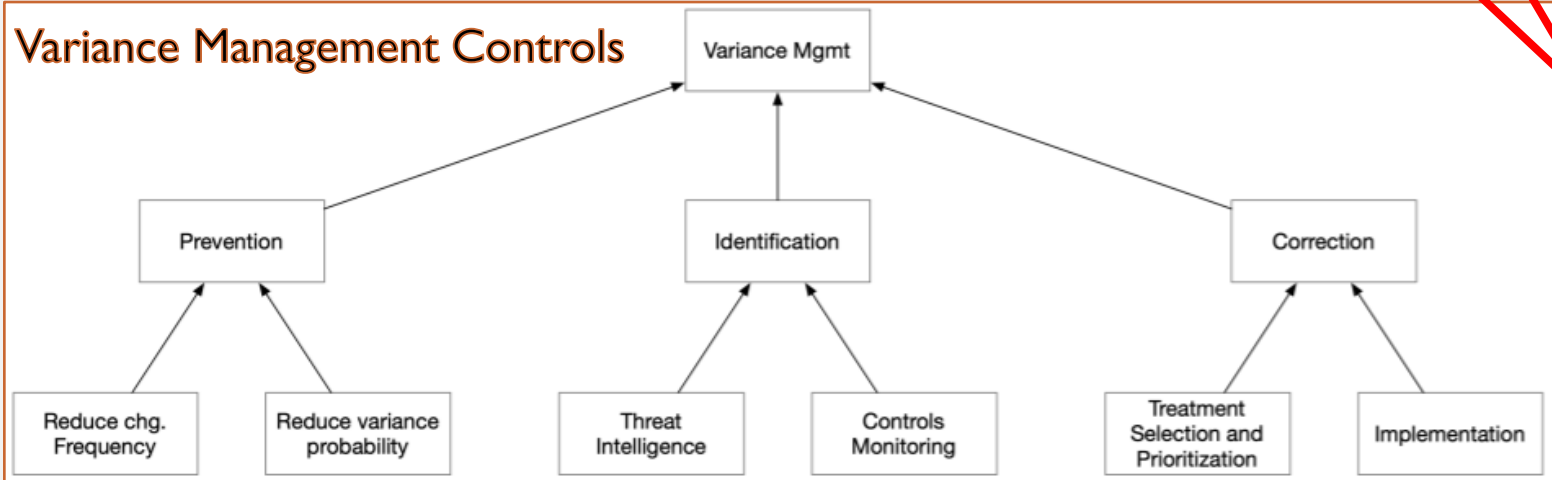

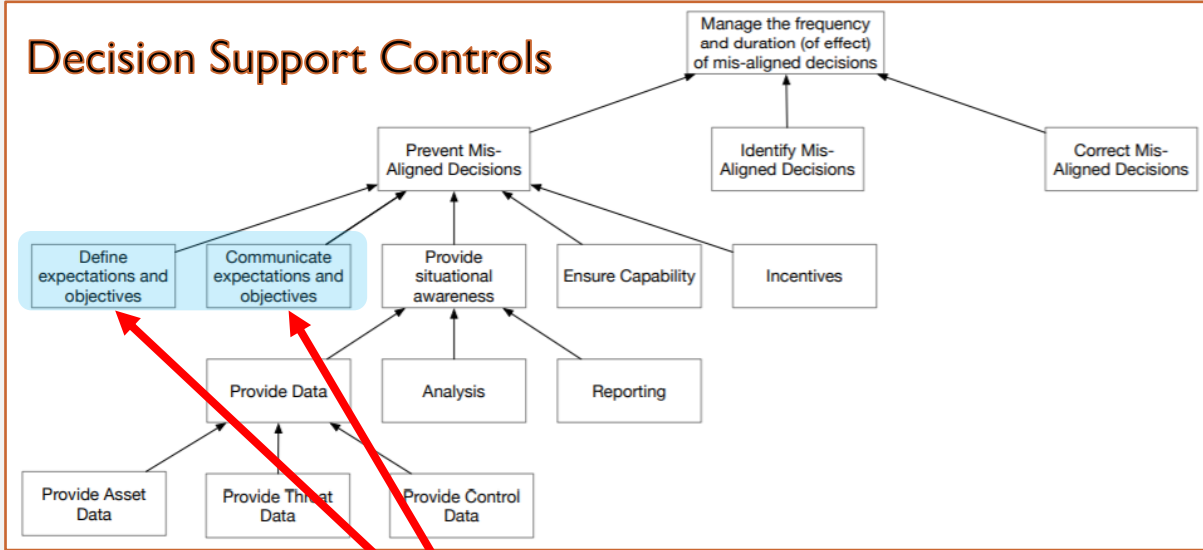

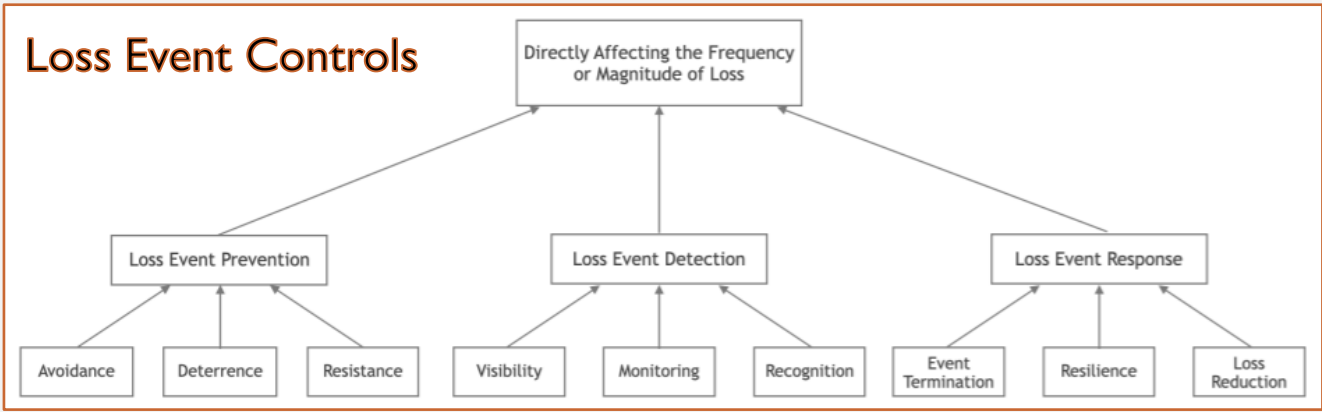

Control 6.2.2 - Teleworking

What to map?

MAPPING EXAMPLE #3

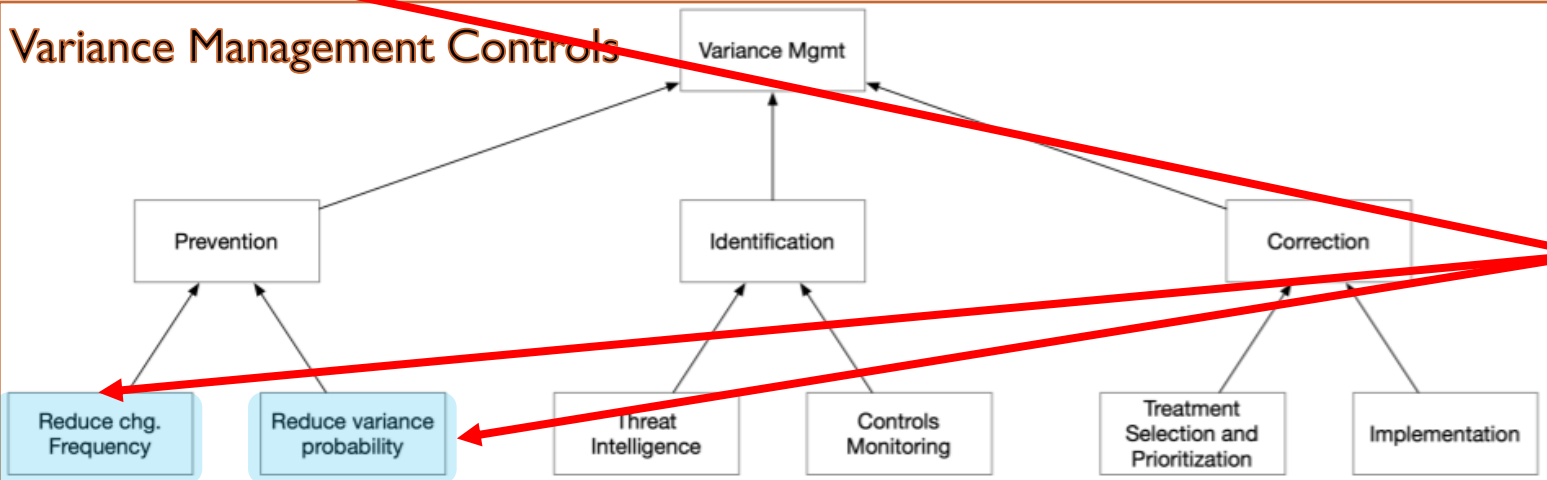

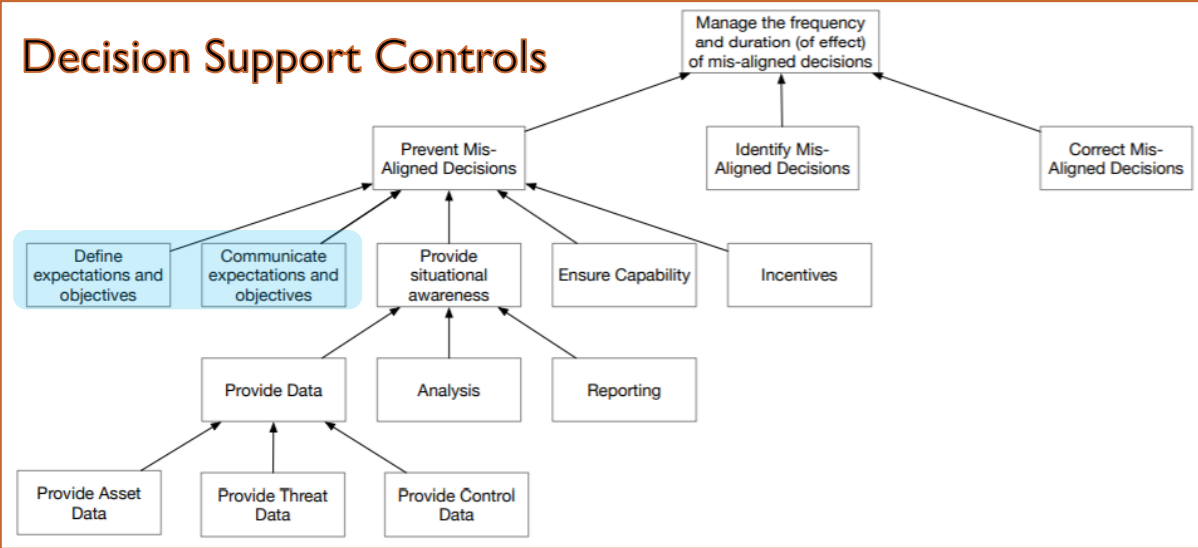

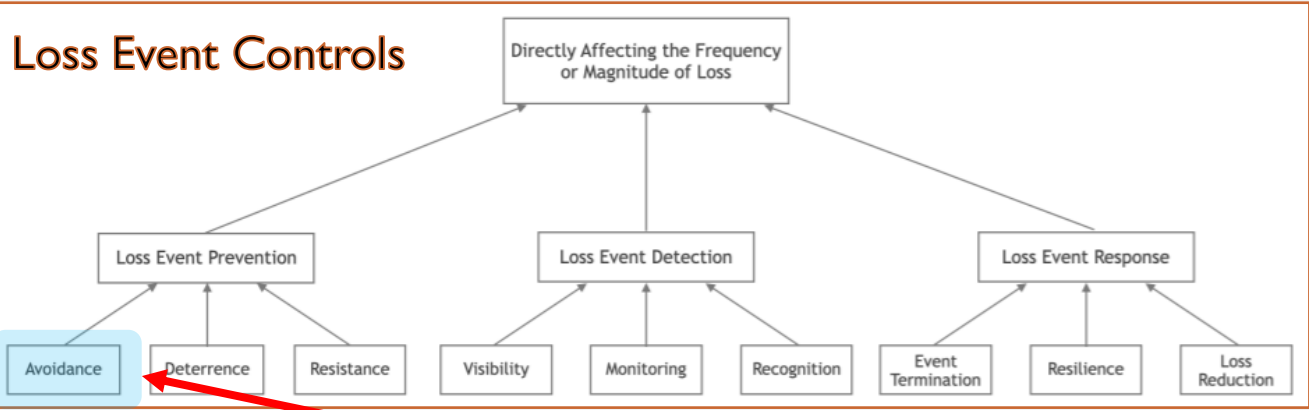

Control 6.2.2 - Teleworking

- Establish policies and communicate the policies for teleworking!

MAPPING EXAMPLE #3

Control 6.2.2 - Teleworking

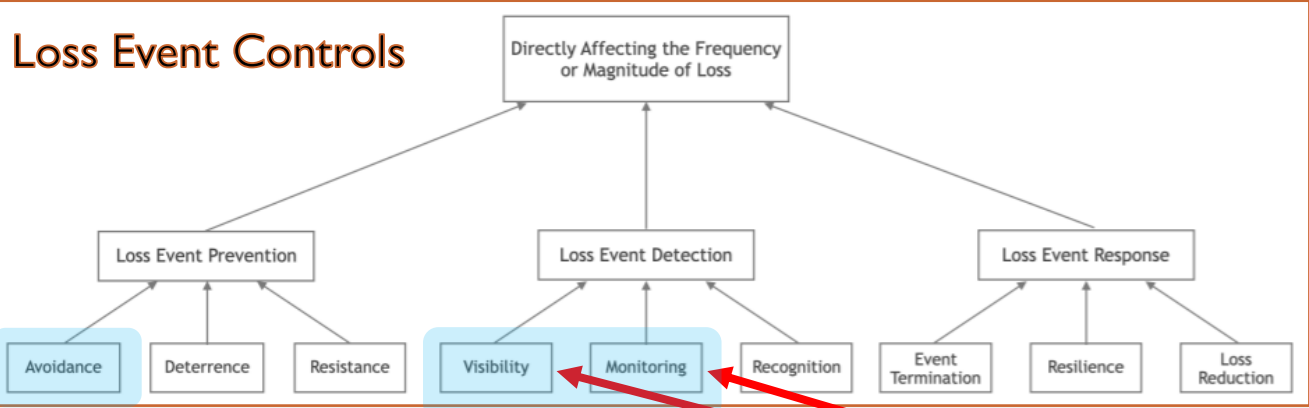

“The provision of virtual desktop access that prevents processing and storage of information on privately owned equipment”

- Are we making prevention?
Reducing the change frequency?
Reducing the variance probability?

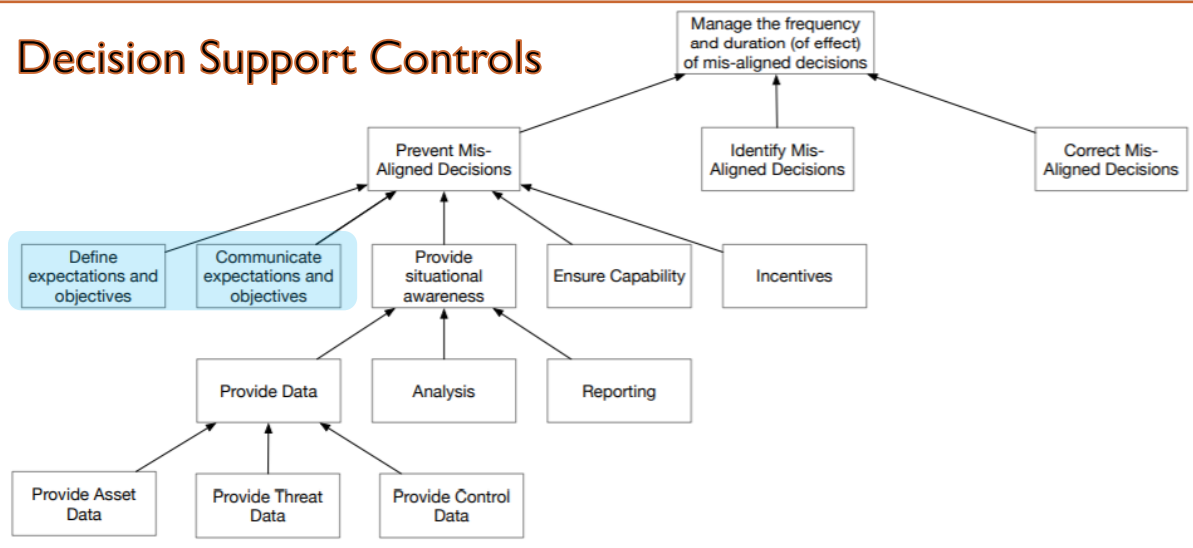

MAPPING EXAMPLE #3

Control 6.2.2 - Teleworking

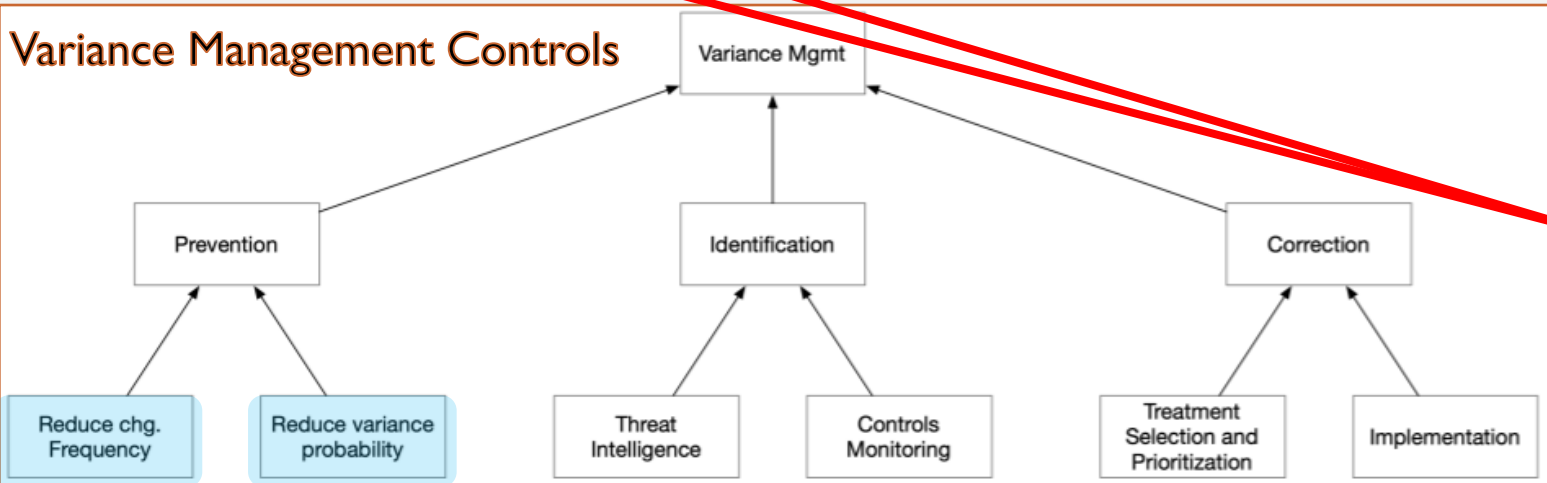

Loss Event Controls

Decision Support Controls

Variance Management Controls

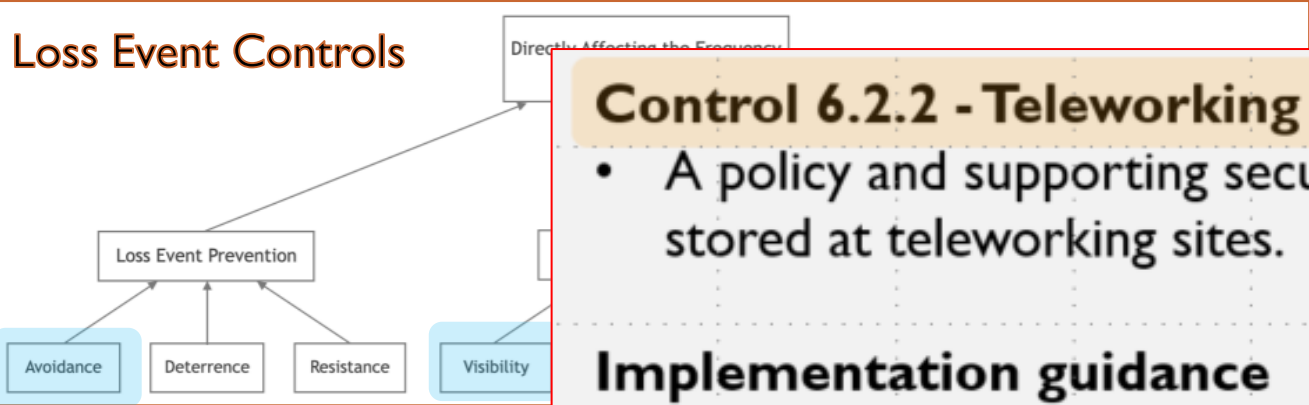

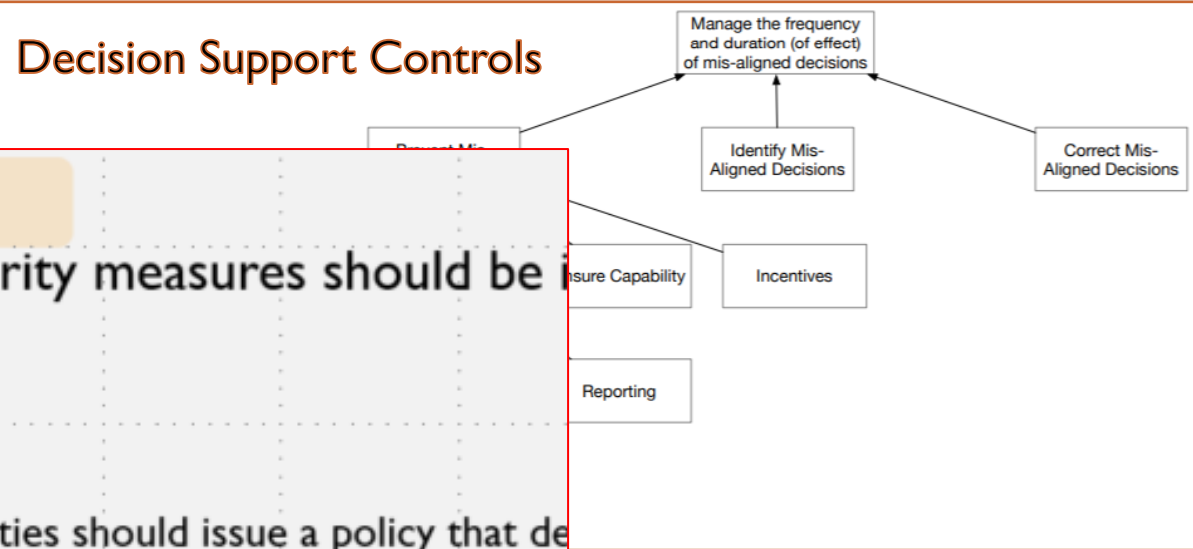

“The provision of virtual desktop access that prevents processing and storage of information on privately owned equipment”

- Is the VDI infrastructure middleware providing visibility and monitoring functionalities?

MAPPING EXAMPLE #3

Control 6.2.2 - Teleworking

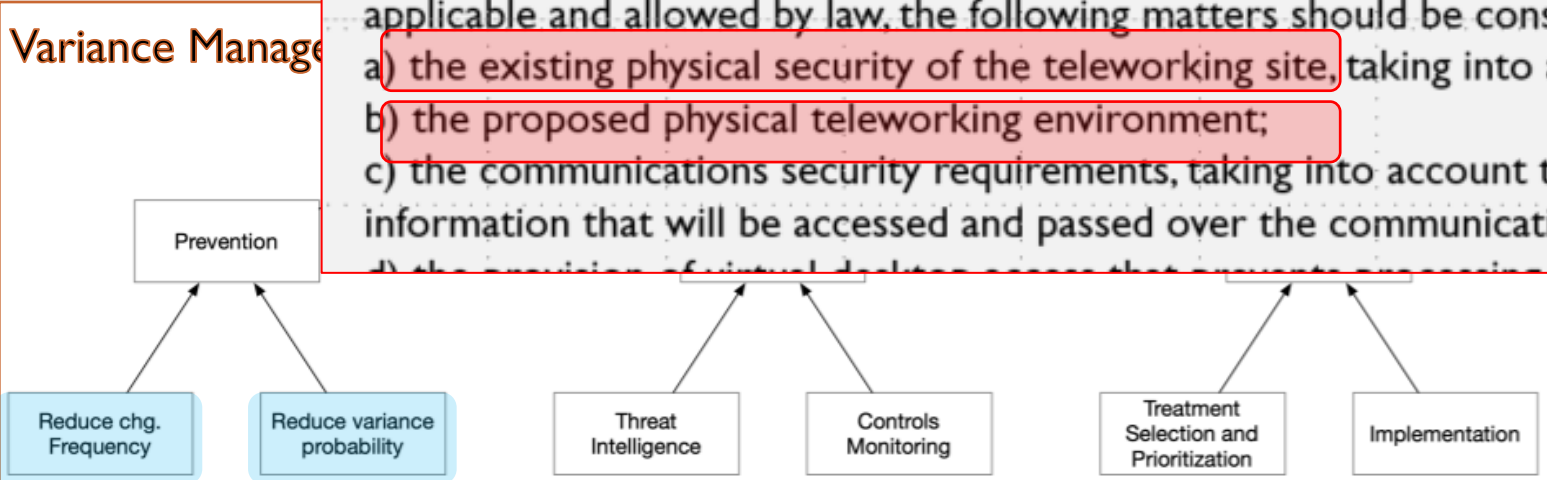

Control 6.2.2 - Teleworking

- A policy and supporting security measures should be stored at teleworking sites.

Implementation guidance

Organizations allowing teleworking activities should issue a policy that de applicable and allowed by law, the following matters should be considered

- the existing physical security of the teleworking site, taking into account
- the proposed physical teleworking environment;
- the communications security requirements, taking into account t information that will be accessed and passed over the communicati
- the provision of physical security measures that ensure the

Further observations

- For some controls additional information from the context and scenario may help in the mapping

The third ingredient: the context

There is no perfect recipe!

Lessons learned:

- Aim to reduce uncertainty
- Precision in the mapping is not theoretically possible
- The mapping (at certain extent) can be defined without taking into account the context
- The mapping can be only valued for a specific scenario
- Threat scenario → ISO 27001 SOA → FAIR CAM → Risk quantification
